A few days after beginning the injections the combs and wattles became brighter in color and grew considerably until the end of June. By October 4 they became bluish, wrinkled, and flabby. There was no noticeable change in the spurs. From the middle of March the hens ceased laying until January, 1908. Though peaceable at the beginning of the experiment they began to attack the cocks a few weeks later. Evidently the testes possess some function which influences or controls the appearance of the secondary sexual characters. The potentiality of differentiation necessary to the production of some at any rate of these characters is present in the cells of the female.

## DAIRY FARMING—DAIRYING—AGROTECHNY.

The farm dairy, H. B. GURLER (*Chicago, Ill.*, 1908, pp. 164, pls. 38, figs. 3).—This popular work, which treats of the dairy herd, cow stables, rations for dairy cows, silos, handling of milk, butter making, and other dairy matters, is of a practical nature. The author dedicates it "to the boys, hoping that it will help them to see the opportunities in the field of agriculture and especially in dairying, the most profitable branch of agriculture when its possibilities are developed."

The care of milk on the farm, I. P. WHITNEY (*Washington Sta. Popular Bul.* 12, pp. 4).—This bulletin contains brief notes on the proper care, handling, and cooling of milk on the farm to avoid premature souring or contamination from dirt and bacteria.

The score-card system of dairy inspection, C. B. LANE and G. M. WHITAKER (*U. S. Dept. Agr., Bur. Anim. Indus. Circ.* 139, pp. 32, dgms. 2, map 1).—The score card system of inspecting the milk supply is explained, and its advan-

tages for the inspector, the dairyman, and the consumer are pointed out. An improved form of score card, which was prepared to secure uniformity in dairy inspection, is explained in detail, and directions are given for using the card for scoring dairy farms and city milk plants. A plan for systematizing and simplifying the work for dairy inspection is described. A list of publications on the testing of milk and cream is appended.

**Dairy investigations,** O. F. HUNZIKER (*Indiana Sta. Rpt.* 1908, pp. 62-69).—Preliminary results are reported of studies on the moisture content of butter and the factors which control its variation, the influence of the period of lactation on the proteids in milk, the effect of heat on milk albumin, the financial loss to creameries by improperly kept composite samples of cream, and the conditions controlling the percentage of solids in the preparation of condensed milk.

**The influence of interrupted milking on the composition of milk,** K. WINDISCH (*Württemb. Wehnbl. Landw.*, 1908, No. 51, pp. 849-851; *Milchw. Zentbl.*, 4 (1908), No. 12, pp. 536-538).—Chemical analyses were made and the specific gravity determined in cow's milk when the first and last portions were drawn into separate receptacles.

**How many grams of digestible protein are needed to produce one kilogram of cow's milk?** J. R. VON MARSZALKOWICZ (*Ztschr. Landw. Versuchsw. Österr.*, 11 (1908), No. 8, pp. 669-700, dgms. 2).—A critical discussion of the work of Armsby, Jordan, Kellner, Hollmann, and others in cattle feeding. The author thinks that with a ration containing abundant carbohydrates and 600 gm. of protein per 1,000 kg. live weight, a cow requires on an average not more than 37 gm. of digestible protein to produce 1 kg. of milk. In support of this view the experiments of the author are cited.

**The variation in the composition of milk,** A. LAUDER (*Edinb. and East of Scot. Col. Agr. Bul.* 15, pp. 35).—This bulletin contains data as to the yield and composition of the milk of 22 Shorthorn cows which constitute the dairy herd at the Mid-Lothian and Peebles county asylum, Rosslynlee.

**The composition of asses' milk,** B. WAGNER (*Ztschr. Untersuch. Nahr. u. Genussmtl.*, 16 (1908), No. 3, pp. 174, 175; *abs. in Chem. Zentbl.*, 1908, II, No. 11, p. 970).—The author gives analyses of the milk of she-asses at different periods after foaling. On the first day there was 8.116 per cent of fat, on the fifth day 2.587 per cent, and on the thirty-fifth day 1.55 per cent of fat. The milk sugar and other solids remained fairly constant.

**The acidity of milk,** H. G. CHAPMAN (*Proc. Linn. Soc. N. S. Wales*, 33 (1908), pt. 2, pp. 436-443).—The acidity of fresh milk, according to the author, is not due to lactic acid but to phosphates and caseinogen. The capacity of milk to combine with sodium hydroxid is increased by heating and diminished by dilution.

**Investigations on milk serum,** A. BURR, F. M. BERBERICH, and F. LAUTERWALD (*Milchw. Zentbl.*, 4 (1908), Nos. 4, pp. 145-156; 5, pp. 210-237; 6, pp. 262-275; *Molk. Ztg.*, 22 (1908), Nos. 15, pp. 401-403; 16, pp. 431, 432).—Studies were made of fresh milk, skim milk, cream, buttermilk, pasteurized milk, and milk coagulated in various ways. Chemical analyses were made and the specific gravity, percentage of acidity, and other properties were determined. Special attention was given to the specific gravity of the sera of whole milk, skim milk, and buttermilk.

The acetic acid method for coagulating milk is recommended as it is rapid, does not affect the specific gravity of the serum, produces no fermentation, and all of the albumin remains in the serum. Rennet is not a good chemical precipitant for raw milk and much less so for pasteurized milk. The average

results obtained from unpasteurized milk, cream, skim milk, buttermilk, and milk sera are summarized in the following table:

*Chemical composition and properties of milk, skim milk, cream, and buttermilk and the sera therefrom.*

Num- ber of inves- tiga- tions.	Nature of coagula- tion.	Specific gravity.	Water.	Nitrogen.	Fat.	Fat-free dry matter.	Degree of acidity (Soxhlet- Henkel).
			<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	
8.....	Milk.....	1.0307	91.04		3.57	8.63	
	Whole milk sera:						
8.....	Acetic acid.....	1.0285	93.39	0.37	.24	6.60	26.9
8.....	Spontaneous.....	1.0277	93.65	.98	.05	6.35	24.8
4.....	Rennet.....	1.0278	93.48	1.09	.11	6.51	4.4
	Skim milk sera:						
8.....	Acetic acid.....	1.0284	93.42	.93	.01	6.58	25.7
8.....	Spontaneous.....	1.0276	93.64	.97	.03	6.36	23.7
4.....	Rennet.....	1.0274	93.48	1.11	.09	6.51	4.3
8.....	Cream.....	1.0051	91.37		25.90	6.76	
	Cream sera:						
8.....	Acetic acid.....	1.0284	93.58	.98	.21	6.47	39.4
8.....	Spontaneous.....	1.0262	93.91	.95	.04	6.09	21.4
3.....	Rennet.....	1.0272	93.44	1.14	.12	6.55	4.6
8.....	Buttermilk.....	1.0297	91.55		1.25	8.34	
	Buttermilk sera:						
8.....	Spontaneous.....	1.0264	93.81	.98	.11	6.18	21.5

The serum from the acetic acid curd contained more fat than when the milk was otherwise coagulated. The acidity of the serum spontaneously coagulated at room temperatures was a little lower than that coagulated in an incubator, but the specific gravity was about the same in both cases.

The specific gravity of pasteurized milk serum was also found to be slightly higher than that of the serum of raw milk, but on allowing it to curdle spontaneously the serum of the pasteurized milk was the lower. Pasteurizing lowered the specific gravity of the serum of cream and of buttermilk. The specific gravity of pure serum from mixed milk is never under 1.0260. The ash content of serum spontaneously curdled varies from 0.75 to 0.8 per cent, a smaller percentage indicating watering.

The use of the refractometer is also of service in detecting watered milk. The refractive power of spontaneously curdled serum should not be less than 8 divisions on a Wollny refractometer. Ten per cent of water will lower it one degree. When the blue solution (copper-glycerin-potash) of Baier and Neumann is added to milk and the power of refraction is under 20 scale divisions the milk has been watered.

Experiments on the germicidal action of cow's milk, P. G. HEINEMANN and T. H. GLENN (*Jour. Infect. Diseases*, 5 (1908), No. 5, pp. 534-541, fig. 1, chart 1).—The authors studied the bacterial content of milk and milk serum obtained by passing milk through a Berkefeld filter. Some of their conclusions are as follows:

"The decrease of bacteria in fresh cow's milk is more decided if fairly large numbers are inoculated than if small numbers only are present.

"The relative increase of bacteria in milk is more pronounced in milk heated to 75° C. or 100° C. than in raw milk or in milk heated to 56° C.

"Milk inoculated with pure cultures of bacteria seems to restrain to a marked degree the multiplication of these bacteria for several hours at 37° C., and for a somewhat longer period at room temperature, excepting in the case of *Strepto-*

*coccus lacticus*, which increases from the beginning, although it may be inhibited to some extent.

"Heating milk to 56° C. for 30 minutes does not entirely destroy the power to restrain the multiplication of bacteria; this power is weakened however, and at 75° C. is destroyed completely. This fact together with the fact that milk serum agglutinates some species of bacteria in vitro to a marked degree seems to favor the assumption that agglutinins are in part responsible for the apparent decrease of bacteria in fresh milk, since bactericidal substances are destroyed by heating to 56° C. for 30 minutes.

"The agglutination of certain bacteria in milk serum seems to bear some relation to the apparent decrease in numbers of bacteria observed in fresh milk, but this is probably not the only factor causing such reduction."

The bactericidal property of milk, J. S. EVANS and T. A. COPE (*Univ. Penn. Med. Bul.*, 21 (1908), No. 9, pp. 264-274, fig. 1, charts 8).—The contradictory conclusions of previous investigators on the subject are reviewed, and it is suggested that the varying results may be due to the variation in methods, as none of these investigators employed absolutely sterile milk. The authors obtained sterile milk by drawing milk from the teat with a cannula connected with rubber tubing to a bottle. The following results were obtained:

"*Streptococcus pyogenes*.—At the end of 4 hours the bacterial content of the unheated milk had decreased 3.5 per cent; that of the milk heated to 55° C., 20 per cent; that of the frozen milk 7 per cent; while the pasteurized and sterilized milks had an increase in their bacterial content of 25 per cent and 10 per cent, respectively, the bouillon control increasing 6 per cent. At the end of 8 hours this wide variation in the percentages of increase disappeared. . . .

"*Staphylococcus aureus*.—At the end of 4 hours the number of bacteria in raw milk had decreased about 20 per cent; the milk heated to 100° C. showed an increase of 100 per cent in bacterial content; in that heated to 68° C. there was an increase of between 10 per cent and 20 per cent; in that heated to 55° C. there was found an increase of 4 per cent; while in that frozen there was an increase of 40 per cent. The bacterial increase in the bouillon control was 1 per cent. . . .

"*Bacillus coli communis*.—At the end of 4 hours this organism decreased 40 per cent in the count in raw sterile milk, while it increased 10 per cent, 25 per cent, 100 per cent, and 2,000 per cent, respectively, in the counts in the milk heated at 55° C., the bouillon control, the milk heated at 68° C., and the milk heated at 100° C. At the end of 8 hours the bacterial content increased rapidly, the raw milk, however, showing the smallest ratio of increase. At the end of 24 hours there was very little difference in the percentages of increase in the various specimens. . . .

"*Bacillus acidi lactici*.—At the end of 4 hours this organism showed an increase of 6 per cent, 55 per cent, 250 per cent, 1,000 per cent, 3,500 per cent, and 2,500 per cent, respectively, in the bacterial content of the raw sterile milk, the frozen milk, the milk heated at 55° C., the milk heated at 68° C., the milk heated at 100° C., and the bouillon control. . . .

"*Bacillus subtilis*.—At the end of 4 hours this organism showed an increase of 5.5 per cent, 2.5 per cent, 20 per cent, 85 per cent, 450 per cent, and 60 per cent, respectively, in the bacterial content of the raw sterile milk, the milk heated at 55° C., the frozen milk, the milk heated at 68° C., the milk heated at 100° C., and the bouillon control."

It would seem from these results that freshly drawn milk possesses a bactericidal activity toward certain micro-organisms and an inhibitory activity toward others. This activity is destroyed at 68° C., and materially impaired at 55° C.

Further trials showed that this bacterial activity varied with different cows. It was also found that "coagulation and acidity of milk do not depend solely upon the bacterial content. They are influenced by natural properties of milk which are soon overshadowed by the metabolic products of bacteria." The authors look upon pasteurized or sterilized milk with disfavor, although realizing that at the present time it is a necessity under certain conditions.

Investigation of pasteurized milk, O. GALVAGNO (*Centbl. Bakt. [etc.]*, 2. *Abt.*, 21 (1908), No. 20-21, pp. 632-647; *abs. in Milchw. Zentbl.*, 5 (1909), No. 1, pp. 35, 36).—The work of other investigators concerning the efficiency of pasteurizing as a method of destroying bacteria is reviewed. The author made many tests to determine the value of different reagents for testing milk at different temperatures. Arnold's tincture of guaiac method gave an immediate reaction at 25° C. Above or below that temperature the reaction was slower. Schardinger's methylene blue and formalin method is reliable but depends upon many factors besides temperature. The Neisser-Wechsberg method is reliable but requires a much longer time than the Schardinger method. Storch's paraphenyldiamin method gives an immediate reaction in raw milk and in milk heated to 70°, but is negative at temperatures above 79°. Saul's orthol reaction was immediate up to 70°, was retarded at 74°, and negative at 78°. An amid potassium iodid solution, to which a drop of hydrogen peroxid was added, gave an immediate reaction up to 70°, but at higher temperatures it was retarded, and 2 or more drops of hydrogen peroxid also delayed the reaction. The magnesium sulphate method proved worthless.

These tests were also used in samples that had been kept 6 days, raw milk and milk heated to 65° C. being kept on ice and at ordinary room temperature. The preservation of the sample made little difference in the Storch or the amid potassium iodid-hydrogen peroxid methods. The guaiac reaction was retarded. The Saul method reacted as when the sample was fresh up to the fourth day, after which the reaction was slower. The Schardinger method was unaffected until the third day, when the reaction was retarded in both the milks kept on ice, and accelerated with the milk heated at 65° and kept at room temperature. On the fourth day the reaction was accelerated in all cases except with the raw milk kept on ice. On the fifth day the reaction was the same in all cases as on the fourth day, except that the reaction with the milk heated at 65° was accelerated. On the sixth day in all cases the reaction was accelerated.

On the therapeutic action of fermented milk, C. A. HERTER (*Pop. Sci. Mo.*, 74 (1909), No. 1, pp. 31-42).—A critical discussion on the therapeutic value of fermented milks of various kinds, especially milk fermented by *Bacillus bulgaricus*. Many physicians report favorable results from the use of milk that has undergone lactic-acid fermentation, but little is known as to the nature of its action. By some it is thought that the beneficial results are due to the antiputrefactive action of lactic acid. The reduction of the carbohydrates to lactic acid and a change from a food containing a large protein content will decrease the amount of putrefiable material, but accurate data as to any direct action on the part of *B. bulgaricus* is wanting. See also a previous note (E. S. R., 20, p. 496).

The effect of hydrogen peroxid on tuberculous milk, A. MONVOISIN (*Rev. Gén. Lait*, 7 (1908), Nos. 4, pp. 73-80; 5, pp. 97-101).—Guinea pigs were inoculated with milk treated with hydrogen peroxid by the method of Much and Römer (E. S. R., 18, p. 368). The results agreed with those of Bergmann and Hultman, that tuberculous germs are not always killed by sterilizing in this way. Bacilli taken from young cultures were thus destroyed, but from older cultures they were more resistant.

Investigations on the influence of salt on the bacteria, yeasts, and fungi of butter, O. FETTICK (*Centbl. Bakt. [etc.]*, 2, Abt., 22 (1908), No. 1-3, pp. 32-44). The initial flora of unsalted butter consist chiefly of bacteria and yeasts, but these begin to decrease in number in about 2 months. At first fungi are present only in small numbers, but gradually increase for several months. In salted butter the fungi disappear in 3 months. The number of bacteria and yeasts begin to diminish in the third month.

The influence of saltpeter on the quality of cheese, A. WOLFF and F. M. BERBERICH (*Molk. Ztg.*, 22 (1908), No. 52, pp. 1487, 1488).—Salt peter is sometimes used to prevent cheese inflation. The authors added 20 gm. of salt peter to 100 liters of milk. For a time the cheese was normal, but after 6 weeks cracks appeared. The aroma and quality of the cheese was good except a slight yeastlike odor near the cracks. A bacteriological examination of the salt peter revealed large numbers of cocci and a few yeasts. It is suggested that many common faults of butter and cheese may be due to bacteria contained in the salt. To prevent infection from this source the salt used in the manufacture of dairy products should be bacteriologically as well as chemically pure and should be kept in closed receptacles.

Cracks in Cheddar [cheese] (*N. Y. Produce Rev. and Amer. Cream.*, 27 (1908), No. 9, pp. 384, 385).—A symposium on this subject by practical cheese makers. The principal causes of cracking are: (1) too much acid; (2) too dry an atmosphere; (3) drafts blowing directly on the cheese; (4) too much fat in the curd; (5) insufficient pressure; (6) dirty, greasy, or sour hoops and bandages; (7) careless carrying of the cheese to the press; (8) allowing the curd to get too cold; (9) extreme heat in the curing room; and (10) too much or too little salt.

Concerning pear tannin and the changes it undergoes in fruit wine making, W. KELHOFER (*Landw. Jahrb. Schweiz.*, 22 (1908), No. 7, pp. 343-410, pls. 4, figs. 5, dgm. 1).—The author reports the results of an extended study of the preparation of pear tannin, its physical and chemical characteristics in comparison with other similar bodies, and the discovery of this tannin in must, with special reference to the making of fruit wine.

Mannitic fermentation in fruit and grape wines, W. BIERBERG (*Mitt. Weinbau u. Kellerw.*, 1908, No. 7, pp. 109-112).—Mannite occurs in many fruits, but usually does not ferment in temperate climates unless the customary fermentations are checked. It occurs more frequently in overripe fruits containing a small amount of acid. To prevent this undesirable fermentation, fruits containing little acid should be harvested early or mixed with more acid fruit. The customary fermentation may be hastened by adding yeast and by regulating the temperature.

Investigations on wine making with sterilized must, A. ROSENSTIEHL (*Chem. Ztg.*, 32 (1908), No. 69, pp. 814, 815).—The author finds that the characteristics of wine are to a large extent independent of the pure yeasts used in fermentation.

The participation of yeasts and the variety of grapes in the formation of the bouquet of wine, A. ROSENSTIEHL (*Chem. Ztg.*, 32 (1908), No. 73, pp. 865, 866; *abs. in Ztschr. Angew. Chem.*, 21 (1908), No. 48, p. 2467).—The nature of the bouquet depends upon the variety of grape, but its strength and development upon the ferment. Some ferments produce no bouquet, while others possess the power to some extent (anthogenous ferments). Musts contain a substance (anthophor) which varies with the variety of grape. Anthophor exists in the plant in an equal amount whether or not the grapes are ripened in the best situation. The ferment, on the contrary, which develops the anthophor is present only when ripened in the best situation.

With our present knowledge, the best results in practice are obtained by sterilizing the grape juice and fermenting with anthogenous yeasts at as low a temperature as 20° C. if possible.

The oil trade at Marseille (*Chem. and Drug.*, 73 (1908), No. 1503, p. 770; *Jour. Soc. Chem. Indus.*, 27 (1908), No. 22, p. 1120).—Marseille now produces an average of 420,000 tons per annum of oil and oil cake from vegetable substances. This output includes oils obtained from the olive, peanut, beachnut, cotton seed, palm, karite, coconut, and castor bean, coco butter, Chinese vegetable lard, and various mixtures sold as salad oils.

Rock salt [in Louisiana], G. D. HARRIS, C. J. MAURY, and L. REINECKE (*Geol. Survey La. Bul.* 7, pp. XI+259, pls. 48, figs. 21).—The investigations reported in this bulletin were made under the direction of the Louisiana Experiment Stations. The report deals with the origin, geological occurrence, and economic importance of rock salt deposits in Louisiana and also contains brief notes and references to all known salt deposits and industries of the world.

### VETERINARY MEDICINE.

The systematic relationships of the Coccaceæ with a discussion of the principles of bacterial classification, C. E. A. and ANNE R. WINSLOW (*New York and London*, 1908, pp. VIII+300, pl. 1, figs. 3; rev. in *Science*, n. ser., 29 (1909), No. 740, p. 387).—This book is stated to be the outgrowth of an attempt to classify certain bacteria of sanitary importance, belonging to the family Coccaceæ. An effort was made to discover natural types among the Coccaceæ by a study of the numerical frequency with which various characters occur. From various sources 500 different strains of Coccaceæ were isolated and submitted to 11 definite and quantitative tests. The results were analyzed with a view to the centers about which each character varied in the series as a whole, and to the general correlation between different characters.

The authors conclude that bacterial groups can be defined, and can only be defined by a study of the numerical frequency of various characters in a large series of cultures. In the Coccaceæ, "two main series, or subfamilies, may be distinguished—one primarily parasitic and the other saprophytic. The groups differ in morphology, staining reactions, cultural characters, and biochemical powers. Within these 2 subfamilies are 8 minor groups which seem to merit generic rank. Each is marked by the correlation of several apparently independent characters, and the eight form, in general, a more or less linear series, connecting such purely parasitic forms as the meningococcus with the saprophytic cocci, so common in the air. Within each genus are included 3 or 4 distinct specific types, each marked by a single peculiarity but sharing the common characters of the genus as a whole. Species and genera alike are connected by numerous intergrading varieties; but the central types in each case are defined by the preponderating frequency of their occurrence."

A key to the genera and species of the Coccaceæ and a bibliography are appended.

Practical bacteriology, blood work, and animal parasitology, E. R. STITT (*Philadelphia*, 1909, pp. XI+294, pls. 4, figs. 82).—In this manual, part 1 is devoted to bacteriology, part 2 to the study of the blood, part 3 to animal parasitology, and part 4 to clinical bacteriology and animal parasitology of the various body fluids and organs. In an appendix are given methods of preparation of microscopic sections, directions for mounting and preserving animal parasites, the preparation of normal solutions, and data regarding diseases of unknown etiology.

Contribution to the study of the bacterial flora of eggs, A. CHRÉTIEN (*Hyg. Viande et Lait*, 2 (1908), No. 6, pp. 247-254).—The author examined spotted eggs and found them to contain bacteria of the genera *Pasteurella*, *Bacterium*, *Sarcina*, and *Staphylococcus*.

Researches on the pathogenic anaerobes, E. VON HIBLER (*Untersuchungen über die pathogenen Anaëroben*. Jena, 1908, pp. 438, pls. 17, rev. in *Brit. Med. Jour.*, 1909, No. 2514, p. 604).—This volume deals with 15 species, including the bacillus of symptomatic anthrax, varieties of bacilli of malignant edema, the tetanus bacillus, and bacilli associated with epidemics of meat poisoning. The cultural characters of these various micro-organisms and diagnostic points of difference are considered in the first part of the book. Data regarding the pathogenicity of the anaerobes and the anatomical and histological character of the lesions produced make up the remainder of the volume.

The ultraviolet viruses, J. M'FADYEAN (*Jour. Compar. Path. and Ther.*, 21 (1908), Nos. 1, pp. 58-68, fig. 1; 2, pp. 168-175; 3, pp. 232-242).—The author considers the ultraviolet viruses at length. Attention is first called to the fact that the virus of contagious bovine pleuro-pneumonia is on the border limit of visibility, since it can just be made out with a magnification of 2,000 and a brilliant illumination. The mosaic or spotted disease of the tobacco plant appears to have been the first disease whose cause was proved to be of the nature of an ultraviolet virus. Foot-and-mouth disease is the first animal disease shown to be due to an ultraviolet virus, an account of which discovery was published in 1898. African horse sickness, fowl plague, yellow fever, cattle plague, sheep pox, epithelioma contagiosum of birds, hog cholera, rabies, cow pox, equine pernicious anemia, canine distemper, blue tongue, and leucocythemia in fowls are the other diseases known to be due to ultraviolet viruses, and here considered.

Immune sera, C. F. BOLDUAN (*New York and London*, 1908, 3. ed., enl., pp. VIII+176, figs. 10).—A third and enlarged edition of this work, which is a concise exposition of our present knowledge concerning the constitution and mode of action of antitoxins, agglutinins, hemolysins, bacteriolysins, precipitins, cytotoxins, and opsonins.

Some examples of malignant disease in animals, J. B. CLELAND (*Jour. Compar. Path. and Ther.*, 21 (1908), No. 3, pp. 242-245, fig. 2).—The author presents an account of cancerous conditions that have been met with during the past 2 years in western Australia, which he considers of interest particularly as showing the widespread distribution of such diseases. These include carcinoma of the breast of a lioness, carcinoma of the udder in a dairy cow, squamous epithelioma of the perineum of a cow, epithelioma displacing the eye of a horse, epithelioma growing from the conjunctival surface of the lower eyelid of a horse and displacing the globe, alveola sarcoma of the mediastinum in a bullock, and a malignant disease (carcinoma) of the suprarenal gland of a sheep.

Veterinary division, A. GRIST (*Dept. Agr. Orange River Colony, Ann. Rpt.*, 4 (1907-8), pp. 77-90).—Glanders is reported as greatly decreased in prevalence during the year under report. A single case of pleuro-pneumonia is said to remain from the outbreaks resulting from its introduction in 1907 from Cape Colony. Although East Coast fever has not yet extended to Orange River Colony, its spread is causing the department much anxiety. Hog cholera has not as yet been reported from the colony. Quarter evil is said to be very prevalent during certain portions of the year, and geil-ziekte as prevalent in the spring. Some 7,000 sheep were vaccinated against blue-tongue during the year with Theiler's preventive vaccine with satisfactory results. Other diseases mentioned as having occurred during the year include anthrax, ulcerative

lymphangitis, scabies, ephemeral fever, geel dikkop, white scour in calves, and jag-ziekte.

Experiments regarding the diagnosis of anthrax, G. MAZZINI (*Arch. Sci. R. Soc. Accad. Vet. Ital.*, 5 (1907), No. 7-8; *Jour. Trop. Vet. Sci.*, 3 (1908), No. 2, pp. 207-216).—The author concludes that "(1) the material should be collected from the animal before advanced putrefaction occurs, preferably not later than 24 hours after death in the summer; (2) the method of Heim, with threads, or that of Fischøder with 2-3 mm. of blood is the best, because putrefaction is thus arrested or impeded; (3) the cultural test is made by sowing a piece of thread saturated with spleen juice on agar; (4) the biological proof on the guinea pig is less reliable on account of the presence of extraneous organisms; and (5) the failure of both these above tests does not exclude anthrax. Heating of the material to 60° C. must be had recourse to."

Vaccination against symptomatic anthrax, E. LECLAINCHIE and H. VALLÉE (*Rev. Gén. Méd. Vét.*, 11 (1908), No. 131, pp. 625-635; *Jour. Compar. Path. and Ther.*, 21 (1908), No. 3, pp. 264-269).—The authors conclude that the method of vaccination against blackleg by the use of pure vaccines meets all the requirements of practice. "In infected areas, the combined use of immunizing serum and of a single vaccine enables the practitioner immediately to check the spread of disease and to vaccinate the contaminated animals without danger, even under conditions where vaccination properly so-called would be dangerous and could only confer protection after considerable delay.

"In noninfected areas, double vaccination with pure liquid vaccines is preferable."

The cause, prevention, and treatment of Mediterranean fever, P. W. BASSETT-SMITH (*Vet. Jour.*, 64 (1908), No. 394, pp. 174-178).—This is a historical résumé of recent work on the disease. The author considers the terms "Malta" and "Mediterranean" fever both wrong and misleading, and prefers the term "undulant" fever to "septicemia of Bruce" as lately used.

Experimental study of the fate of tetanus toxin in the digestive canal. H. VINCENT (*Ann. Inst. Pasteur*, 22 (1908), No. 4, pp. 341-352; *abs. in Bul. Inst. Pasteur*, 6 (1908), No. 13, pp. 605-607; *Centbl. Bakt. [etc.]*, 1. Abt. Ref., 42 (1908), No. 11-13, pp. 370, 371; *Vet. Rec.*, 21 (1908), No. 1059, p. 260).—The author has found that the tetanus toxin is destroyed in vivo in the stomach of the guinea pig in less than 1 hour. In the duodenum and large intestine it is destroyed after 2 or 3 hours. It was found that the gastric, biliary, pancreatic, and enteric juices in vivo destroy the toxicity of the tetanus poison. The author interprets this as a phenomenon of digestion, as he finds that the digestive and antitoxic properties of the gastric and pancreatic ferments vary in very much the same way under similar conditions.

A report on trypanosomiasis of domestic stock in northwestern Rhodesia. R. E. MONTGOMERY and A. KINGHORN (*Ann. Trop. Med. and Par.*, 2 (1908), No. 2, pp. 97-132, pls. 4, map 1).—The authors conclude that trypanosomiasis of domestic stock is very prevalent in the northern area of northwestern Rhodesia, and that it is due to *Trypanosoma dimorphon*, *T. vivax*, and a trypanosome morphologically allied to *T. brucei*. While *T. theileri* also occurs it does not appear to cause serious damage. These trypanosomes may be transmitted by *Glossina morsitans*, *Stomoxys calcitrans*, and a species of *Lyperosia*.

Reports of the "sleeping sickness" expedition to the Zambesi for the years 1907-8, A. KINGHORN and R. E. MONTGOMERY (*Ann. Trop. Med. and Par.*, 2 (1908), No. 2, pp. 53-76).—Data on the distribution of tsetse flies are included in this report.

A note on the occurrence of a large trypanosome in the blood of native cattle in South China, C. M. HEANLEY (*Jour. Compar. Path. and Ther.*, 21

(1908), No. 2, pp. 178, 179, figs. 4).—A trypanosome that corresponds in size with *Trypanosoma theileri*, and also has the long flagellum and acutely pointed posterior extremity of that organism, has been taken from cattle at the cattle depot at Hong-Kong.

A peculiar form of streptotrichosis among cattle, J. D. E. HOLMES (*Jour. Trop. Vet. Sci.*, 3 (1908), No. 3, pp. 289-300, pls. 4, figs. 5).—The author presents a report of a study made of a disease that appeared among army transport bullocks in Calcutta in 1907. The clinical features of the disease are said to bear a resemblance to equine epizootic lymphangitis.

Redwater in England and its carriers, S. STOCKMAN (*Jour. Compar. Path. and Ther.*, 21 (1908), No. 3, pp. 225-232; *Vet. Jour.*, 64 (1908), No. 401, pp. 538-548, charts 4; *Vet. Rec.*, 21 (1908), No. 1067, pp. 391-401, charts 4).—This paper is based upon 3 years' investigations of the disease in Great Britain in collaboration with J. McFadyean, a more complete report of which will be published later.

Contrary to reports previously published in the United Kingdom, the author has found the disease to be inoculable in a way similar to the Texas fever type. Only two species of ticks (*Ixodes ricinus* and *Hemaphysalis punctata*) have been met with in England on cattle and sheep. Each of these species drops for both molts. *I. ricinus* has been found the most often in redwater pastures. *H. punctata* though much more restricted in its distribution than *I. ricinus* is more common in the southeast of England and has been obtained from redwater farms on which *I. ricinus* could not be found.

The few experiments made with *I. ricinus* failed to show that infection passes through the eggs to the seed ticks. Four experiments made with *H. punctata* in which larvæ were engorged upon infected hosts and placed as nymphs upon susceptible hosts all resulted negatively. Similar results were obtained when the larvæ from an infected female were used. In both of two experiments, however, in which nymphs that had engorged on infected hosts were placed as adults upon susceptible hosts, the disease was produced.

The difficulty in destroying the ticks is shown by the fact that the immature stages require but 3 or 4 days to engorge and drop. This habit of dropping for the molts appears to be favorable, however, in that the ticks are not carried far to infect new territory. The author does not consider the number of ticks found on the animal to have any relation to the severity of the attack but considers such to depend upon the virulence of the Piroplasma. The greater prevalence of the disease from May to August is said to correspond to the period in the year at which adults are most numerous. As a prevention of the disease the author recommends that cattle be kept off infected pastures, that such pastures be well stocked with sheep, and that the sheep be dipped or sprayed at intervals of 10 days, particularly during the season at which the adult ticks are in evidence. This recommendation is based upon the fact that 10 days or more are required for the female ticks to engorge.

Investigations on the nature of hog cholera and methods for its control. UHLENHUTH ET AL. (*Arb. K. Gsndhtsamt.*, 27 (1908), No. 3, pp. 425-671; *abs. in Centbl. Bakt. [etc.]*, 1. Abt., Ref., 41 (1908), No. 14-16, p. 480; *Bul. Inst. Pasteur*, 6 (1908), No. 12, p. 565; *Rev. Gén. Méd. Vét.*, 12 (1908), No. 139-140, p. 414).—The authors have investigated the disease in Germany and corroborated the results obtained by Dorset, Bolton, and McBryde of this Department, and proved the identity of German "schweinepest" with the English swine fever and American hog cholera. The virus was found to pass through Berkefeld, Pukall, and Heim filters.

The disease can not be produced by the injection of filtrates from cultures of *Bacillus suispestifer*, or by filtrates of serum or organ extracts from healthy

animals. *B. suispestifer* is a saprophyte present in the intestines of healthy swine, having been found in the intestinal contents in 51 of 600 normal hogs examined. It was isolated in 76 of 271 examinations made of animals affected with hog cholera. Swine inoculated with *B. suispestifer* were not immune to hog cholera. The ultravisible virus was present in the blood, bile, and urine, the urine of diseased hogs being highly infectious. It does not appear to occur regularly in the feces, as filtrates from the intestinal contents of 4 affected hogs examined, which exhibited extensive intestinal lesions, were not infectious.

The virus retained its virulence for 23 days when kept in the refrigerator and for 10 weeks when kept at room temperature. In serum it resisted heating 2 hours at 58° C., but was destroyed at the end of 1 hour when exposed to a temperature of 78°. The blood continues virulent after 24 hours of refrigeration at -18°. Twenty-four hours drying of the virus at 27° in blood and serum does not destroy it. The limit of resistance appears to be close to 60°. A 0.1 per cent solution of bichlorid of mercury used in the proportion of 1:2 and a 5 per cent solution of carbolyzed glycerin used in the proportion of 2:5 did not kill the virus in defibrinated blood after 8 days' contact. In buried organs putrefaction destroys the virus in from 1 to 4 weeks. Horses, cattle, donkeys, goats, dogs, cats, fowls, pigeons, rabbits, guinea pigs, wild and tame rats, and gray and white mice are resistant to the virus. The serum from hyperimmunized hogs showed a strong protective power.

The swine plague ("schweineseuche") bacteria found in the lung lesions in the course of hog cholera are considered as constant but harmless organisms of the respiratory passages of healthy pigs and their pathogenicity as due to the diminished resistance in animals affected with hog cholera.

A bibliographical list is appended.

Suggestions for an organized plan to combat hog cholera, A. D. MELVIN (*Wallaces' Farmer*, 34 (1909), No. 11, p. 385).—In order that the possibilities of well-directed work may be brought to the attention of those who may in the future have hog cholera to deal with, the author has outlined the following suggestions for combating the disease through serum immunization as worked out by the Bureau of Animal Industry of this Department.

"The serum should be prepared by the State experiment stations or by live stock sanitary boards which are properly equipped with laboratory facilities, the efficacy of all serum to be determined by the laboratories before distribution.

"The field application of the serum should be in the hands of the State live stock sanitary board or State veterinarian.

"The State should be organized into districts, each in charge of a deputy State veterinarian or a deputy appointed by the live stock sanitary board. These districts should be small enough to permit the deputy to exercise close watch over them.

"The deputy State veterinarian should keep a supply of serum on hand to see that prompt action is taken when infection appears.

"Hog raisers generally throughout the State should be informed when this serum is available for distribution, and if necessary compulsory notification of the presence of disease in a herd should be imposed.

"Upon notification to the deputy in charge of the district or the State live stock sanitary board or State veterinarian that hog cholera has appeared in a certain neighborhood the diseased herd or herds should be immediately quarantined, the premises disinfected as thoroughly as possible, and all hogs on the farm which have been exposed or which are not visibly ill should be treated with the serum alone. All hogs on the farm which have not been exposed should be treated by what is termed the serum-simultaneous method, and of course the prompt burning or burial of dead animals should be enforced. At

the same time all hogs on surrounding farms should be treated by the serum-simultaneous method."

Investigations into the hematogenous nephritis of swine, K. DEGEN (*Untersuchungen über die hämatogene Nephritis des Schweines. Inaug. Diss., Univ. Giessen, 1907; rev. in Berlin. Tierärztl. Wehnschr., 1908, No. 31, p. 548; Vet. Rec., 21 (1908), No. 1048, p. 95*).—The disease is not a specific one due to a single micro-organism but to a polybacterial infection. The author estimates that 5 per cent of all swine slaughtered in Dresden are affected.

Infectious anemia of the horse, M. FRANCIS and R. P. MARSTELLER (*Texas Sta. Bul. 119, pp. 3-19, figs. 8, dgm. 1, charts 5*).—This is a preliminary report on the symptoms and post-mortem examinations of a number of horses and mules affected with an obscure wasting disease prevalent in the flat coastal district of Texas and similar to infectious anemia reported from Nebraska, Minnesota, North Dakota, Manitoba, and other localities. Intermittent fevers and emaciation are the conspicuous symptoms of this disease. The author estimates that 80 per cent of the affected animals die within a few weeks.

Inoculation experiments were conducted with a virus obtained in October, 1907, from a horse (No. 1) at Katy, Harris County, a summary of which is here given in tabular form.

*Results of inoculation experiments.*

Animal.	Infection.		Effect.	Remarks.
	Source.	Form.		
Horse No. 2..	Horse No. 1.	5 cc. of blood subcutaneously, 5 cc. of blood intravenously.	Chronic type ...	Inoculated Oct. 25, 1907; alive Nov. 18, 1908, though very thin.
Horse No. 3..	Horse No. 2.	2 cc. in bouillon intravenously, 1 cc. in bouillon subcutaneously.	Died on 51st day.	Virus lived 48 hours at 37° C. before injection.
Horse No. 4..	Horse No. 3.	10 cc. blood serum .....	Died on 20th day.	Horse killed to end suffering.
Horse No. 5..	Horse No. 2.	2 cc. of blood subcutaneously.	Died on 25th day.	Acute fatal type.
Horse No. 6..	Horse No. 5.	1 cc. of blood subcutaneously.	Died on 153d day.	Slow chronic type.
Mule No. 7 ..	Horse No. 6.	1 cc. of blood subcutaneously.	Chronic type ...	Remained in good physical condition.
Mule No. 8 ..	Mule No. 7..	4 cc. of blood subcutaneously.	.....	
Mule No. 9 ..	Mule No. 7..	4 cc. filtrate subcutaneously.	Died on 44th day.	
Mule No. 10..	Horse No. 2.	.....	Mild reaction ..	Not susceptible.
Horse No. 11.	Horse No. 2.	2 cc. of blood subcutaneously.	Died on 22d day.	Blood obtained from horse No. 2 12½ months after it was inoculated.

A calf, sheep, goat, and pig were inoculated subcutaneously with 1 cc. of blood taken from horse No. 2, and one of each was also inoculated with a similar amount of blood taken from horse No. 5. None of these was susceptible. A dog inoculated subcutaneously with 1 cc. of blood from horse No. 6 was not susceptible.

The infection is thought to be due to an ultravisible organism which can be conveyed to other horses and mules by subcutaneous and intravenous injections of blood. The blood of animals that survived the first attack and regained much of their lost flesh and spirit is as capable of producing the disease one year after primary infection as during the first sickness. It seems probable that the blood remains virulent during the life of the animal affected. Mule No. 7 while susceptible resisted the infection to such a degree as to continue in good health. "This may make the detection and eradication of the disease a

very difficult matter, as mule No. 7 would to-day pass almost everyone as sound while the blood is still infectious." It has been found that while some mules regain much of their flesh and strength when well fed and not worked, almost every horse dies in spite of the best care and attention.

Immunization against glanders, A. MARXER (*Rev. Gén. Méd. Vét.*, 12 (1908), No. 133, pp. 1-5; *abs. in Jour. Compar. Path. and Ther.*, 21 (1908), No. 3, pp. 269-271).—An account is given of experiments conducted in association with E. Levy and F. Blumenthal, based upon the idea that vaccines might be prepared by treating the bacteria with solutions of chemical substances which were indifferent to the bacteria but were capable of changing the osmotic pressure and thus enfeebling the bacteria without killing them, without seriously altering their constitution, or without modifying the antigens which are so important in producing immunity.

Glycerin and urea are said to possess such properties. The attenuation of the virus of glanders in solutions of glycerin and urea is said to be proportional to the temperature and inversely proportional to the density of the emulsion. Experiments were first made with the guinea pig, then with the horse. Emulsions containing urea are most useful, as they can readily be evaporated to dryness and reduced to a powder which keeps for a long time, even at comparatively high temperatures. Complete immunity was produced in horses by a single injection of 600 mg. of dead bacilli or 2 injections of 300 mg. each of dead bacilli with urea. The immunity conferred lasts at least a year.

In practice it is convenient to inject under the skin a dose of 100 mg. of the immunizing powder, followed at intervals of a week by doses of 200 and 250 mg.

The mallein reaction in nonglandered horses, H. J. SÜDMERSEN (*Vet. Jour.*, 64 (1908), No. 394, pp. 197, 198).—"Immune horses rarely give any rise in temperature (3 cases in 50), and when such a rise does take place the maximum is reached at 12 hours after injection and the temperature rapidly falls and reaches the normal in about 24 hours."

The author's experience with glandered horses has been that the maximum temperature is not reached until the fifteenth hour and the fall is only gradual. "Out of 26 horses with large local reactions, and which were shown to be glandered on post-mortem examination, 19 had considerable increase in temperature (average rise 2.7° F.) while 7 gave very little rise (average 1.1° F.). The local reaction obtained upon immune horses also differs from that of glandered animals."

Preventive vaccination against strangles, F. S. H. BALDREY (*Jour. Compar. Path. and Ther.*, 21 (1908), No. 2, pp. 158-162).—"As a result of these experiments it would appear that subcutaneous vaccination with either a broth culture killed under toluol, or an agar culture in salt solution killed at a temperature of 58° C., will have a very considerable effect in raising an animal's resistance to a streptococcic infection, and is therefore useful as a preventive to the disease. Control animals will show a more or less severe abscess when tested with a nonlethal dose of strangles streptococcus culture, whereas the vaccinated animal will suffer practically no ill effects."

Investigation of an outbreak of horse surra with result of treatment with atoxyl, tartar emetic, mercury, and other drugs, J. D. E. HOLMES (*Jour. Trop. Vet. Sci.*, 3 (1908), No. 2, pp. 157-172, pls. 2).—The author reports an outbreak of surra in India in 1907 and the results obtained from treatment with atoxyl, mercury, and tartar emetic.

Continuation of experiments on protective inoculation against equine piroplasmiasis, A. THEILER (*Jour. Compar. Path. and Ther.*, 21 (1908), No. 2, pp. 97-148).—The experiments, which are here reported in detail, have been

continued on a somewhat different line from previous ones, as a result of the observation, made in connection with Texas fever, that the inoculation of cattle with blood of a calf immune from the disease is not so frequently followed by strong reactions and mortality as when the blood is derived from a full grown animal.

"The inoculation of animals with horse foal blood of the first, second, and third generations caused a mortality of 6 out of 186, or 3 per cent.

"The inoculation of animals with horse foal blood of the fourth, fifth, sixth, seventh, and eighth generations caused a mortality of 1 in 22, or 4.5 per cent.

"The inoculation of animals with donkey foal blood of second to sixth generations caused no mortality amongst 173 animals.

"The reactions caused by injection of horse foal blood were more severe than those given by injection of donkey foal blood.

"No cases of relapses after discharge have occurred, proving that the immunity given by the injection of donkey foal blood is as good as that afforded by horse foal blood.

"For further immunization purposes, therefore, I recommend the passing of blood originating from a natural infection of a donkey with *Piroplasma equi* through donkey foals, and to use 1 cc. blood from the fourth generation and upwards, bearing in mind the precautionary measures mentioned above.

"Finally, all foals kept for tapping purposes, and used in connection with the inoculation, must be kept free from ticks. This precaution has been carried out at this laboratory with all foals used in the experiments, as it stands to reason that a reinfection by means of ticks would increase the virulency of the blood which is to be used as vaccine."

Typhoid fever of the horse—a piroplasmosis, A. PRICOLA (*Vet. Jour.*, 64 (1908), No. 400, pp. 490-494, fig. 1).—The author presents an account of the disease produced by *Piroplasma equi*. According to the author's experience and to the statistics of the Italian war department, this disease is spread over all Italy, including Sicily and Sardinia, but seems to be localized in centers from which it has little tendency to spread. The disease may be conveyed by injections of blood of diseased horses into healthy susceptible ones.

"The morphological characters of the parasite, its manner of reproduction, transmission of the disease by injection of the blood, clinical features, and post-mortem appearances show that Italian equine piroplasmosis is identical with equine piroplasmosis described by Theiler in South Africa, and generally with all equine piroplasmosis found in Africa and Asia."

A résumé of our knowledge of canine piroplasmosis with an outbreak amongst the hounds of the Madras hunt, H. T. PEASE and W. D. GUNN (*Jour. Trop. Vet. Sci.*, 3 (1908), No. 2, pp. 175-190, pl. 1, charts 4).—Following a review of the present knowledge of malignant jaundice of dogs the author reports an outbreak of the disease in Madras hounds. Temperature charts are presented.

Acariasis as found in the transport animals employed on field service BARRY (*Vet. Jour.*, 64 (1908), No. 396, pp. 280-294, figs. 8).—Next to the horse the camel is considered the most important animal of transport affected, acariasis being very prevalent among them. Mules are frequently used on field service, but in the author's opinion are less subject to scabies. The ass, sometimes used for pack purposes, though receiving little or no care is not affected to any extent, and when affected it is usually with the psoroptic acariasis.

On the prophylaxis of trypanosomiasis, with particular reference to the influence of the camel in India, R. E. MONTGOMERY (*Jour. Trop. Vet. Sci.*, 3 (1908), No. 3, pp. 301-329).—The author discusses this subject at some length. Attention is called to the fact that the basis of trypanosomiasis prophylaxis is

the prevention of union between the three essential factors—the reservoir, the transmitting agent, and the receptive host, a combination of any two to the absolute exclusion of the third being harmless.

Concerning certain parasitic protozoa observed in Africa, J. E. DUTTON, J. L. TODD, and E. N. TOBEY (*Pt. 1, Liverpool School Trop. Med. Mem. 21, 1906, pp. 87-97, pls. 2, fig. 1; pt. 2, Ann. Trop. Med. and Par. 1 (1907), No. 3, pp. 287-370, pls. 13, figs. 35*).—Protozoal parasites of mammals, birds, reptiles, amphibians, fishes, and arthropods are here considered.

On some parasites in the museum of the school of tropical medicine, Liverpool, A. LOOSS (*Ann. Trop. Med. and Par., 1 (1907), No. 1, pp. 123-154, pls. 3*).—Eight species of endoparasites, one of which is new, are considered in this account.

The presence of *Spirochæta duttoni* in the ova of *Ornithodoros moubata*, R. M. CARTER (*Ann. Trop. Med. and Par., 1 (1907), No. 1, pp. 157-160, pl. 1*).—The author concludes that ticks infected by spirochetes lay infected eggs, that multiplication of the spirochetes probably takes place in the eggs, and that morphological changes in the spirochetes also occur in the eggs.

On the morphology and life history of *Spirochæta duttoni*, A. BREINL (*Ann. Trop. Med. and Par., 1 (1907), No. 3, pp. 435-438, pl. 1*).—"The life history of the spirochete might be thus summarized: Just before the crisis the spirochetes disintegrate, certain of them coiling up into skeins, the majority of which are phagocytosed by the spleen. Some of them become encysted and break up into very small bodies, out of which the new generation of spirochetes is evolved."

Contribution to the study of the *Porocephalus moniliformis*, A. BRODEN and J. RODHAIN (*Ann. Trop. Med. and Par., 1 (1908), No. 4, pp. 493-504, pl. 1*).—Observations on the occurrence of this parasite at Leopoldville, in Kongo Free State, are here reported. A description is presented of the larvæ.

## RURAL ENGINEERING.

Irrigation in the Sacramento Valley, California, S. FORTIER ET AL. (*U. S. Dept. Agr., Office Expt. Stas. Bul. 207, pp. 99, pl. 1, figs. 24*).—The investigations reported in this bulletin include a study of the present status of irrigation in the Sacramento Valley, its advantages, possibilities, methods, and costs. That this valley has not shared in the wonderful development which has taken place in other fertile valleys of the arid region is believed to be due largely to two conditions which have retarded the introduction of irrigation. First, that the climate permits grain and hay to be grown in the winter months and matured in the spring; and second, that the size of the majority of holdings is large. In 1907 less than 1 per cent of the arable land was irrigated.

Regarding the general development of the valley through irrigation, the authors believe that three operations are involved, namely: (1) Protective works to control floods, estimated to cost \$24,000,000; (2) providing a water supply for irrigation, \$50,000,000; and (3) preparing the land for irrigation, \$35,000,000. In this connection the introductory chapter of the bulletin gives a review of the present agricultural situation, in which are discussed early efforts at development, soil, climate, overflow conditions, etc., and the general status of irrigation development.

The method followed in the investigations was to make detailed studies of representative localities and general observations of the remainder of the territory. The localities selected were the lands irrigated under the Yolo County Consolidated Water System, Yolo County, under the Central Canal in Glenn and Colusa counties, under the Butte County Canal in Butte and Sutter counties,

and along Stony Creek in the vicinity of Orland. The report of these investigations includes a brief description of the chief features, followed by "an investigation of the various subjects pertaining to the use of water in irrigation, embracing the conveyance of water and its delivery to users, character of water rights, and cost of water, seepage, and evaporation losses both in the channels and on the fields, duty of water under main canals and laterals and on individual farms, proper methods of preparing the land, methods of applying water, ascertaining the right time to irrigate, the removal of waste water, irrigated products, etc."

In connection with the investigations along Stony Creek there were conducted eight experiments to determine the amount of water used by farmers under usual conditions. In five of these experiments devoted to alfalfa an area of 67.9 acres yielded under irrigation an average of 5.38 tons per acre for the season at an average cost of \$1.78 per ton. The net depth of water applied as averaged for four of these and one other alfalfa experiment was 4.15 feet, this being the difference between the quantity entering the field and that wasted. In an experiment with lemons the net depth applied was 1.76 feet. The results of the experiments led to the conclusion that an unnecessary amount of water was used on the crops, and he gives at the end of the bulletin a few suggestions regarding the economical use of water.

The hydrologic station of Abbeville, P. HOULLIER and H. PELLET (*Bul. Assoc. Chim. Sucr. et Distill.*, 26 (1908), No. 6, pp. 427-444, figs. 2).—An account is given of the equipment and work of this station, which is connected with a beet-sugar factory of Abbeville. The station was established to study the relation between rainfall, evaporation, transpiration, and drainage, particularly with reference to the water requirements of the sugar beet. It is equipped with rain gauges, evaporimeters, vegetation cases, and other appliances necessary for exact measurements of rainfall, drainage, evaporation, and transpiration. The results of studies during 1906, 1907, and 1908 on evaporation from fallow soil and from soil planted to sugar beets are reported, as well as of a study of the amount of water required for the growth of sugar beets.

Earth roads, A. R. HIRST (*Wis. Geol. and Nat. Hist. Survey Road Pamphlet 1*, pp. 32, figs. 13).—This is the first of a series of pamphlets issued by the Wisconsin Geological and Natural History Survey on the subject of roads. It is intended to give in a brief form the best methods of earth road construction, and to point out how to obtain the best results for the amount expended.

The earth road drag, A. R. HIRST (*Wis. Geol. and Nat. Hist. Survey Road Pamphlet 2*, pp. 24, figs. 4).—The object and benefits of road dragging are discussed here, with an explanation of the proper construction and use of the drag. The material is largely compiled from reports of the Illinois State Highway Commission, and from a bulletin on rural highways issued by the Survey.

Stone and gravel roads, A. R. HIRST (*Wis. Geol. and Nat. Hist. Survey Road Pamphlet 3*, pp. 32, figs. 12).—This is the third of the series noted above and considers briefly the main points to be observed in stone and gravel road construction. There are described and illustrated the approved practices in stone road construction, but it is stated that the bulletin should be considered more in the nature of a preliminary guide to prospective road builders than as a treatise.

Culverts and bridges, A. R. HIRST (*Wis. Geol. and Nat. Hist. Survey Road Pamphlet 4*, pp. 54, pl. 1, figs. 15).—The design and construction of culverts, with particular reference to the materials used, is taken up quite fully in this pamphlet, and directions for making concrete culverts are given in detail.

The subject of bridges is treated in a general way, with illustrations and descriptions of types in use and suggestions to communities regarding the selection of the most suitable kind. The material on bridges, it is stated, is largely taken from a report of the Illinois State Highway Commission.

Implements and machinery at the Smithfield Show (*Impl. and Mach. Rev.*, 3 $\frac{1}{2}$  (1909), No. 405, pp. 1098-1134, figs. 29).—In this report there are briefly described several new steam traction and portable explosive engines as well as numerous farm machines and implements.

Trials with seed drills and cultivators, C. V. BIRK (*Tidsskr. Landökonomi*, 1908, No. 5, pp. 289-298).—Three 2-row seed drills and 17 different cultivators were included in these trials and were judged by the committee on trials of farm machinery of the Royal Agricultural Society of Denmark.

Water aspirators for homes, T. H. NORTON (*Mo. Cons. and Trade Rpts.* [U. S.], 1909, No. 340, pp. 208-210).—According to data summarized by the author, an ordinary laboratory suction pump may be used with rubber tubing for dusting and cleaning in the home.

Practical paint tests in 1907, E. F. LADD (*North Dakota Sta. Bul.* 81, pp. 577-714, figs. 11).—There is given in this bulletin an account of painting tests which were carried out in continuation of work previously reported (*E. S. R.*, 18, p. 209). Tests were made with specially prepared paints furnished by the Paint Manufacturers Association of the United States, and considered to be representative of manufacturers' formulas, and also with commercial white lead submitted by the manufacturers. The paints comprised the whites, warm drabs, and yellows of 18 different formulas.

The paints and leads were applied in various manners to fences made of four types of lumber and so constructed as to give a wide range of conditions.

The substance of the bulletin is made up of detailed reports of these tests, covering formulas, directions for application, and data concerning the areas covered and the weight of paint used. The results are given of examinations which were made of the fences at periods of 6 months and 1 year, and of the condition of the paints after standing for about 8 months in the can.

Tests were also made on a number of houses with practically the same paints as used on the fences, and these are described.

## RURAL ECONOMICS.

Report of the Country Life Commission, L. H. BAILEY ET AL. (*U. S. Senate*, 60. Cong., 2. Session, Doc. 705, pp. 65).—This includes a special message from the President of the United States transmitting the report to Congress, and an account of the purpose and methods of the commission in their inquiries into the economic and social conditions surrounding rural life at the present time.

In addition to a general statement, the report discusses the main special deficiencies in country life, as disregard of the inherent rights of land workers, highways, soil depletion and its effects, agricultural labor, health in the open country, and woman's work on the farm. According to the commission, the general corrective forces that should be set in motion are along the line of agricultural or country life surveys, a redirected education, cooperative effort, the country church, and personal ideals and local leadership. The report has also been discussed editorially (*E. S. R.*, 20, p. 601).

Rural conditions in Maine, T. J. LYONS (*Ann. Rpt. Bur. Indus. and Labor Statis. Me.*, 22 (1908), pp. 84-299).—This article sets forth the rural conditions in every county and township in the State, the data being compiled by the labor commissioner from the replies to a circular letter of inquiry sent to representative farmers. Special topics also discussed are the agricultural resources of

Maine, abandoned farms, farm labor and immigration with accounts of the Finn colonies near West Paris and in South Thomaston, population of towns and rural districts, farm wages, and loss in rural population.

The average monthly farm wages in Maine in 1907 was \$26.14, a gain of 42 per cent since 1887. With regard to the rural population, the decrease "has not been so marked in the last 8 years as is shown by the census figures from 1860 to 1900."

Farming west of the 100th meridian, JAMES WILSON (*Breeder's Gaz.*, 54 (1908), No. 12, pp. 1215, 1216).—This is a description by the Secretary of Agriculture of the work of this Department in soil surveys, the introduction and culture of crops, the conservation of soil moisture, and the utilization of the natural resources of the semiarid or dry lands of the Great Plains region.

Agriculture in the Po Valley (*Economist*, 68 (1909), No. 3418, p. 455).—This is a review of S. Pugliese's book on Two Centuries of Agriculture in the Vercellese District of the Po Valley. The book treats of the economic conditions among the laboring classes in the district, system of agriculture practiced, changes in labor conditions during two centuries, systems of land tenure, rents, contracts, prices, and women's wages.

Agriculture in Bavaria according to the latest statistics, ZAHNRECHER (*Vrtljschr. Bayer. Landw. Rat.*, 13 (1908), No. 4, pp. 387-397).—This is a comparative study of the Bavarian census figures of 1882, 1895, and 1907, with special reference to the agricultural population. The percentages of the whole population engaged in agriculture in these years were 50.9, 45.8, and 40.3, respectively. The independent farmers in 1882 numbered 406,007 and in 1907 435,421, a relative decrease, when compared with the increase of population, of 1.4 per cent. The number of farm laborers increased from 1,097,267 in 1882 to 1,257,516 in 1907, a relative increase of 1.3 per cent.

[Land occupation, live stock, and agriculture in New Zealand], E. J. von DADELSZEN (*New Zeal. Off. Yearbook* 1908, pp. 468-495).—Statistical returns in 1908 are presented and discussed. Of 73,367 holdings, 21,186 ranged from 1 to 10 acres in size, 12,147 from 10 to 50 acres, and 10,098 from 100 to 200 acres, the last alone being a decrease over 1907 (*E. S. R.*, 19, p. 1089).

Crop Reporter (*U. S. Dept. Agr., Bur. Statis. Crop Reporter*, 11 (1909), No. 4, pp. 25-28).—Statistical data on the condition of crops in the United States and foreign countries, the condition and losses of farm animals, and the value and prices of agricultural products are reported.

Scientific investigation and its relation to practical farm work, E. J. JAMES (*Breeder's Gaz.*, 54 (1908), No. 12, pp. 1191, 1192).—The importance of science in promoting the progress of agriculture and national welfare by investigations on soils, the culture and adaptation of crops, the prevention of animal diseases, the invention of agricultural machinery, and the use of electricity on farms is discussed in this article.

The problem of farm returns, A. OSTERMAYER (*Wiener Landw. Ztg.*, 58 (1908), No. 98, pp. 961-964).—The data as to the returns from 10 different-size farms in the district of Mähren are discussed and compared with similar data from 29 other farms in the same section of country for the purpose of determining the system of farm management that will give the best returns to capital and labor.

The supply of farm labor, G. K. HOLMES (*Ann. Amer. Acad. Polit. and Soc. Sci.*, 33 (1909), No. 2, pp. 362-372).—This article is an analysis of the situation concerning the supply and character of farm labor in the United States, with suggestions as to the best means of conserving, increasing, and improving farm labor. These means include retaining the children on the farm, the farmers' institute movement, practical demonstration work among farmers by experts

from this Department and the State experiment stations, the development of agricultural education, and the agencies which are at work to improve the dwellings of country people, their modes of living, their home life, and their social life. These influences, it is believed, "may be depended upon to save to our agriculture all the labor it will need for the maintenance of our national self-sufficiency."

A history of the English agricultural laborer, W. HASBACH (*London*, 1908, pp. XVI+470; rev. in *Economist*, 68 (1909), No. 3412, *Sup.*, pp. V, VI; *Jour. Roy. Statis. Soc.*, 71 (1908), No. 4, pp. 722-725).—A history of the agrarian problem in England to the year 1907, with particular reference to the development of the agricultural proletariat during the past two centuries.

The breaking of contracts by agricultural laborers, F. MENDELSON (*Landw. Wchnschr. Sachsen*, 11 (1909), Nos. 11, pp. 115-117; 12, pp. 127, 128).—Statistics are presented and discussed regarding the prevalence of contract breaking among different classes of agricultural laborers in Saxony, the data being confined largely to the years 1907 and 1908.

Free agricultural employment agencies in Sweden, W. MÜLLER (*Illus. Landw. Ztg.*, 28 (1908), No. 93, pp. 799, 800).—The author describes the operation of the free employment agencies that have been established in ten of the chief cities of Sweden since 1902. Their chief value lies in locating on farms the unemployed in cities, particularly those persons who had left farms to seek employment in the cities. A great number of laborers have already been won back to farm life, and the extension of the agencies throughout Sweden is urged in behalf of agriculture and the national welfare.

State assistance to agriculture in Switzerland, L. VON HENNET (*Mitt. Fachberichterstat. K. K. Ackerb. Min.* [Vienna], 1909, No. 4, pp. 25-28; *Jour. Bd. Agr.* [London], 15 (1909), No. 11, pp. 864, 865).—The law of 1893 for the promotion of agriculture is discussed. Subsidies under its provision are now granted for the following lines of work: Agricultural instruction, establishments for research and experiments, improvement and insurance of cattle, soil improvement by drainage and irrigation, measures against plant diseases, and insurance against hail, and for agricultural societies and syndicates.

The encouragement of agriculture [in Switzerland]. Mutual aid and agricultural education (*Bul. Mens. Off. Renseig. Agr.* [Paris], 8 (1909), No. 1, pp. 55-64).—Notes are given on the different forces in operation for the promotion of agriculture. These include the state inspection of plants and animals offered for sale, federal and state assistance for various undertakings, and agricultural associations, expositions, legislation, and education.

Data are presented regarding the date of origin, organization, membership, and state financial aid to the more important agricultural societies in Switzerland.

The union of Swiss peasants (*Bul. Mens. Off. Renseig. Agr.* [Paris], 7 (1908), No. 12, pp. 1559-1562).—This society was organized in 1898 and has for its object the furtherance of agricultural interests in Switzerland. In 1907 the organization had more than 98,000 members and published two monthly journals. One of its chief economic inquiries has related to the determination of the profitableness of agriculture in Switzerland, accounts of which have already been noted (*E. S. R.*, 19, p. 691; 20, p. 587).

Concerning the establishment of a central agricultural credit bank, V. CAMANNI (*Bol. Quind. Soc. Agr. Ital.*, 14 (1909), No. 1, pp. 10-12).—The author favors the establishment in Italy under state supervision of a central bank serving both public and private ends, but with particular reference to the furnishing of credit to agriculturists.

Report on the working of cooperative credit societies in the Punjab for the year ending June 30, 1908. S. WILBERFORCE (*Rpt. Work. Coop. Credit Soc.*

*Punjab, 1908, pp. 14+XI*).—The number of rural mutual credit societies increased during the year from 174 to 253 and the surplus was 53,864 rupees (about \$17,450), or twice as large as in July, 1907 (*E. S. R.*, 20, p. 390). The rate of interest charged by the societies is less than 10 per cent, while private money lenders charge 25 per cent or more.

### AGRICULTURAL EDUCATION.

**The college of agriculture and the State**, L. H. BAILEY ([*Ithaca, N. Y.*], 1909, pp. 36).—A notable address on the functions of a State agricultural college, delivered during Farmers' Week at Cornell University, February 26, 1909, and intended to be preliminary to a State campaign for rural progress to supplement the work of the National Country Life Commission.

There is presented an analysis of the agencies already at work, the relations of the agricultural to the general educational system, and the relations of the agricultural college to present social problems. The author held that inasmuch as civilization develops out of industries and occupations, and the agricultural colleges represent this civilization, they can not be properly considered as class institutions. The three-fold function of such colleges, the "discovery of fact, teaching it to students, taking it to all the people," was clearly emphasized and elaborated. The suitable training of agricultural teachers was characterized as the "greatest work now before this college." The present support of college education in agriculture in the State of New York was shown to be at the rate of only one sixty-sixth of 1 per cent of the property valuation of the State.

**Agriculture in secondary schools**, T. F. HUNT (*Ann. Rpt. Penn. Dept. Agr.*, 13 (1907), pp. 382-395).—A review is given of progress in introducing agriculture into secondary schools, and attention is called to available literature and other facilities to aid in carrying on such work.

**Rural education**, A. C. TRUE (*Ann. Rpt. Penn. Dept. Agr.*, 13 (1907), pp. 231-237).—Attention is called to the desirability of introducing instruction in agriculture into the rural school curriculum, and examples of successful work along this line are cited.

**The education of the farmer**, C. DE MAR (*Ann. Rpt. Ohio Bd. Agr.*, 62 (1907), pp. 572-575).—This paper, read at the farmers' institute held at Newtown, Ohio, December 6, 1907, discusses the value of farmers' institutes, the importance of home industrial training, recreation, and good, business-like farm management.

**Domestic science**, ALICE PENROSE (*Ann. Rpt. Ohio Bd. Agr.*, 62 (1907), pp. 478-481).—This paper, read at the farmers' institute held at Damascus, Ohio, February 26 and 27, 1908, points out in detail the value for girls of this kind of work in furnishing immediate application in the home for the facts learned in school in the lines of cooking, chemistry, bacteriology, and physiology. These applications are of great service in interesting the mothers as well in the advancement of modern domestic practice.

**The nature-study outlook**, L. H. BAILEY (*Nature-Study Rev.*, 4 (1908), No. 6, pp. 169-172).—This informal address considers several important considerations in nature-study work. The author maintains that the ordinary public school seems to lack motive power, being dominated too much by system, regularity, and college ideals, and that "the formal literary college entrance requirement is not an expression of the best activities of living." He believes that while nature-study work should be systematic, definite, and have relation, nevertheless it is easy to make it so formidable as to take the life out of it. "Laboratory teaching may be just as far from life as book teaching is; it all depends on the intention and the mode."

Wanted: A philosophy of nature study, C. H. ROBISON (*Nature-Study Rev.*, 4 (1908), No. 7, pp. 206, 207).—This important theme is treated suggestively rather than elaborately. Emphasis is laid upon the belief that the method of approach must depend on the philosophic basis of our theory "on whether we regard the child as a member of a present and a future society or as an isolated individual, as a social creature, or solely as an intellectual being." The author considers aims and theory as being still in a chaotic state, needing a master's treatment; so that while the "what" is rather definitely understood, the "why" leaves much to be desired, and the "how" must be largely conditional on a clearly worked out rationale. He concludes that much of our present procedure rests on faith rather than on definitely determined psychological results.

The training of teachers of nature study, J. W. SHEPHERD ET AL. (*Nature-Study Rev.*, 4 (1908), No. 6, pp. 173-182, 193-196).—The first of these papers points out that a large part of elementary science work has been diluted college work, that much of the laboratory work does not raise a personal problem for the individual student, and that the nature-study teacher must come over to the children's standpoint and concern herself with furnishing them rich, vital experiences, rather than developing scientific generalities. To this end the student-teacher should herself have experiences as a student with the same kind of material that the children will use in nature study.

O. P. Dellinger, in discussing the same general subject, holds that the nature-study training course should differentiate nature study from what it is not, make clear the aim of nature study as distinct from that of other related subjects, acquaint the student-teacher with the literature of the subject, give a few type outlines of lessons, and stratify the work for the different grades.

M. A. Bigelow sets forth the belief that nature study should not be limited to any particular phase of the subject, that direct observational study is the essential method, that the study should be made from the standpoint of nature as it touches our daily lives, and that close imitation of the technical science of higher schools is highly undesirable for nature study in the elementary schools.

C. F. Hodge contributes a paper the essence of which appears in the following quotation: "It would be far better if biology teachers in our normal schools be drawn from graduates of our agricultural colleges, or from the ranks of intelligent gardeners and horticulturists, than from those who have had the present biology course in many colleges and have been given no hint that it is not and can not be 'adapted' to the needs of normal-school students and grade pupils. If the colleges are to train normal-school teachers in biology, it is imperative that they supplement their present technical courses by a thorough course in biological nature study."

Nature courses and science courses, W. F. GANONG (*Nature-Study Rev.*, 4 (1908), No. 8, pp. 242-246).—This is a reply to a criticism offered by C. F. Hodge on the ordinary courses in secondary science work, as noted above. The author defends them on the ground that they are practicable of educational administration, that the information they impart is worth far more to the majority of students than that offered as substitutes under the name of nature study, and that they give an intellectual training far superior.

Recent aspects of the nature-study movement, E. DAVENPORT (*Nature-Study Rev.*, 4 (1908), No. 9, pp. 261-264).—The author points out the advantage of agriculture as nature study in the fact that it utilizes the child's personal desire to produce something, and thus awakens the three strongest impulses to activity—his observing powers, the possibility of exerting controlling influence over natural processes, and the actual production of objects that had no

previous existence as such. He believes that the appeal of agriculture lies in its utility to the race, and that certain phases of agriculture, well taught in a good high school, are a valuable means of education for any man, as well as for the one who is to be a farmer. He suggests, for example, that there is no plant known to botany more significant in its histological and physiological aspects than is Indian corn, which has the added advantage of a deep significance to our social and economic welfare; for "we learn more from inference, even in school, than we do by the direct method."

**A school-room study of a robin's nest, JESSIE R. MANN** (*Nature-Study Rev.*, 4 (1908), No. 9, pp. 265-271, fig. 1).—This study was undertaken as a definite attempt to answer questions raised by the children concerning the number of times a day young birds are fed, whether the father helps in the feeding, what kind of food the parents bring, and how long before the young will fly. Each pupil prepared ruled sheets of paper for the following items: (1) The number of the feeding for that day, (2) time of feeding, (3) the parent bringing the food, (4) the kind of food brought, (5) the nestling fed (numbered 1, 2, or 3 with ink on its bill), and (6) remarks. Complete all-day observations were made for 6 days—for 3 days in succession in the beginning and for the last 3 days before the birds left the nest when 13 days old. Progressive drawings were made of the dorsal view of the young birds, the leg and wing structure compared with the human limbs, the development of feather growth and structure, and sketches of the alimentary canal with a study of its functions.

### MISCELLANEOUS.

**Twenty-first Annual Report of Arkansas Station, 1908** (*Arkansas Sta. Rpt. 1908*, pp. 16).—This includes the organization list of the station and a report of the acting director, the latter containing an account of the work and publications of the station and a financial statement for the fiscal year ended June 30, 1908.

**Twenty-first Annual Report of Indiana Station, 1908** (*Indiana Sta. Rpt. 1908*, pp. 97).—This contains the organization list, reports of the director and heads of departments, the experimental work of which is for the most part noted elsewhere in this issue, a list of the periodicals received by the station, a list of the bulletins and circulars issued by the station to January 1, 1909, and a financial statement as to the Federal and miscellaneous funds for the fiscal year ended June 30, 1908, and as to the State funds for the fiscal year ended September 30, 1908.

**Twenty-first Annual Report of Louisiana Stations, 1908** (*Louisiana Stas. Rpt. 1908*, pp. 46).—This contains the organization list, a report of the director and departmental reports on the work of each of the stations and of the State geological survey, lists of available publications and of those issued during the year, a summary of the analytical work on fertilizers, feed stuffs, Paris green, and miscellaneous material, and a financial statement as to the Federal funds for the fiscal year ended June 30, 1908, and as to the State funds for the fiscal year ended November 30, 1908.

**A visitor's guide to the more important features of the station's work. F. H. BALLOU** (*Ohio Sta. Circ. 85*, pp. 54, figs. 60).—A revision of a circular previously noted (*E. S. R.*, 18, p. 691).

**Accessions to the Department Library, October-December 1908** (*U. S. Dept. Agr., Library Bul. 70*, pp. 61).

## NOTES.

---

**Arkansas University and Station.**—The appropriations received from the legislature for the ensuing biennium aggregate \$64,900, an increase of \$29,700. An appropriation of \$8,000 has also been made for farmers' institute work, which has been organized as a department of the college, with G. A. Cole, the former agriculturist, as superintendent.

Dr. R. R. Dinwiddie has retired from active station work, but will continue as consulting pathologist and bacteriologist.

**Colorado College.**—C. A. Lory, for several years professor of physics and electrical engineering, has been elected president.

**Connecticut State Station.**—At the request of the Massachusetts authorities, Dr. G. P. Clinton, botanist of the station, has gone to Japan to secure and bring to this country, if possible, a fungus which is parasitic on the gipsy moth.

Clarence Rodman resigned as chemist on May 8, and has been succeeded by R. B. Roe.

**Hawaii Federal Station.**—The territorial legislature at its recent session made an appropriation to the station of \$5,000 annually for the next biennial period, to enable the carrying on of more extensive experiments in forage production, crop rotation, soil studies, and plant diseases. In addition to this sum, about \$5,000 annually from funds derived from a territorial income tax is to be at the disposal of the station.

The desirability of improving transportation facilities and marketing methods of Hawaiian agricultural products has become generally recognized in the Territory, and with a view to securing a basis for practical legislation the appointment by the governor of a commission to investigate the matter was authorized. The special agent in charge of the station has been made chairman of this commission, and work has already been begun. Cooperation has been effected with the promotion committee, the chamber of commerce, various associations of growers, and the farmers' institute, and it is expected that financial assistance can be obtained from the legislature upon the formulation of a suitable working plan.

**Illinois University and Station.**—According to *Illinois Agriculturist*, C. E. Lee, assistant professor of dairy manufactures in the university and assistant chief in dairy manufactures in the station, has accepted the assistant professorship of dairy husbandry at the University of Wisconsin.

**Iowa College and Station.**—*Science* notes the resignation of E. T. Robbins, assistant animal husbandman, to accept a position on the editorial staff of *The Breeders' Gazette*.

**Louisiana Stations.**—A substation for rice culture has been established at Crowley, and work began there this spring. Local parties gave 60 acres of land for the use of the station and subscribed \$3,500 for buildings. The last legislature authorized the establishment of a rice station, but made no appropriation. It will be maintained for the present out of the fertilizer funds. The Bureau of Plant Industry of this Department will cooperate in the work by stationing a rice specialist there and sending experts from time to time.

**Maine University.**—Because of the great demand for teachers competent to teach agriculture in secondary schools, the college of agriculture will offer a one-year course in agriculture for teachers, to begin September 15. The course is open to college graduates, to high-school teachers with at least two years' experience, and to normal-school graduates who have had three years' experience in teaching.

**Michigan College and Station.**—At a recent meeting of the governing board Dr. W. J. Beal was appointed station botanist, this including membership in the station council. Dr. J. B. Dandeno was appointed assistant botanist and a member of the advisory staff.

In connection with the extension work of the college and station an experimental union has been organized. In the spring of 1908, 32 farmers undertook cooperative experiments in alfalfa growing, and during March and April of the present year 93 farmers, 67 of whom had attended the short courses, undertook cooperative work with grains. About 62 bushels of improved seed have been furnished by the college and distributed in 46 counties. Under the arrangement agreed upon, the cooperator pays the freight or express charges and reports results to the college.

**Minnesota University and Station.**—According to the *Minneapolis Morning Tribune* of May 8, the board of regents has established in the college of agriculture a two-year course in industrial and agricultural education for the preparation of teachers in the agricultural high schools provided for by the recent legislature. A summer school for teachers is being held for three weeks, beginning June 21.

A short course in traction engineering has been offered for the four weeks beginning May 25. The course of study included steam boilers, traction and stationary steam engines, gasoline, kerosene, and denatured alcohol engines, and their operation, repair, etc.

*Minnesota Farm Review* notes the appropriation by the legislature of \$2,000 for tobacco experiments.

**Missouri University.**—The enrollment in the university courses in animal husbandry is now 456, an increase of 86 per cent in the last three years. A considerable portion of the increase is in the elective courses. In addition, the short course enrollment in animal husbandry courses for the year was 160, as compared with 50 in 1907.

**Nebraska University and Station.**—Dr. S. Avery, acting chancellor since December, 1908, has been appointed chancellor of the university. Dr. C. E. Bessey, who was dean of the industrial college, which has recently been divided into separate colleges of agriculture and engineering, has been appointed head dean in the university, thereby becoming chairman of the board of deans and acting chancellor in the absence or indisposition of the chancellor. E. A. Burnett and C. R. Richards, formerly associate deans in the industrial college, have been made deans of the colleges of agriculture and engineering, respectively.

The new college of agriculture is to include the university work in general and technical agriculture, forestry, and domestic science. The departments of soils and farming crops have been reorganized into a department of instructional agronomy and farm management and a department of experimental agronomy. These are to be in charge, respectively, of C. W. Pugsley and E. G. Montgomery. The former will also act as soil agronomist in the station. T. A. Kiesselbach has been transferred from instruction work to become assistant in experimental agronomy. P. B. Barker has been appointed adjunct professor of agronomy and assistant in agronomy (soils) in the station.

Other recent appointments include R. E. Stone as assistant professor of agricultural botany and assistant in the station; R. C. Ashby and Ellis Rail as adjunct professors of animal husbandry; R. S. Trumbull as adjunct professor of agricultural chemistry; R. F. Howard as adjunct professor of horticulture, and Erwin Hopt as assistant in field crops at the North Platte substation, and instructor of agronomy in the school of agriculture. Alvin Keyser resigned as professor of soils June 1 to accept the professorship of agronomy in the Colorado College and Station.

*Science* notes that the regents are taking steps to locate the two additional substations provided for by the legislature; one is contemplated for the sand hill regions of central Nebraska and the other in the irrigated section in the western part of the State.

**New Jersey College and Stations.**—Daniel W. Horner, John E. Darnell, Samuel B. Ketcham, Abram C. Holdrum, and Henry Bell, of the board of managers of the State Station, and J. B. Drury, of the board of trustees of the college, have resigned and have been succeeded by Alexander P. Owen, of Mickleton, A. Engle Haines, of Medford, Frank E. Bate, of Fishing Creek, Philip Todd, of Peapack, Albert Richards, of Dover, Charles C. Basley, of Maywood, and Edwin Radford, James McCarthy, and Emil Bonnot, of Jersey City.

Dr. B. H. A. Groth, a graduate of Harvard University, was appointed plant physiologist of the college station April 1, for research under the Adams Act. Leon A. Congdon, a graduate of Syracuse University, has been appointed assistant chemist at the State Station in connection with the fertilizer and feedstuffs inspection.

**Cornell University.**—The legislature has appropriated \$175,000 for the maintenance of the college of agriculture, an increase over last year of \$25,000.

**New York State Station.**—In connection with the proposed grape investigations in Chatauqua County, the station has leased a 30-acre farm near Fredonia, where work will be carried on in general vineyard management and the investigation of grape diseases and insects. In the grape disease work the Cornell Station is to cooperate. F. E. Gladwin, previously a nursery inspector under the State department of agriculture, is to be in general charge of the work in Fredonia, and Frederick Z. Hartzell, of Cornell University, has been appointed to carry on the entomological investigations.

W. J. Young, formerly scientific assistant in the Bureau of Chemistry of this Department, has accepted a position as student assistant in horticulture at the station.

**North Dakota Station.**—A pure-seed law has been enacted by the legislature, under which a seed-inspection laboratory is to be established at the station.

**Oregon College.**—The college is offering a reading course of five lessons in poultry husbandry. A set of questions accompanies each lesson, and at the end of the course a written examination will be given. Satisfactory completion of the course will count a certain number of points in a poultry contest to begin in the fall, though the taking of the course will not be required of those entering the contest.

**Pennsylvania College and Station.** The appropriations by the legislature for the ensuing biennium for the college and station aggregate \$525,999.76. Among the items of expenditure authorized are \$170,786 for the school of agriculture and the station, \$169,050 for the school of engineering, \$9,368 for the maintenance of the department of home economics, and \$4,000 for the institute of animal nutrition.

**Porto Rico Station.**—Martin J. Iorns, horticulturist since December, 1906, died in the hospital at San Juan, May 17. Doctor Iorns was born in Louisiana in

1867, and was graduated from Cornell College, Iowa, in 1892. Upon graduation he engaged in civil engineering work and later in teaching, serving as principal of several schools in Iowa and Illinois and as instructor in Cornell College. He took up graduate work at the University of Chicago in 1898, specializing for three years in chemistry, botany, physics, and geology, and serving as laboratory assistant.

In 1900 he was appointed to the chair of science of Fort Worth University, Texas, and also served as lecturer in the medical college. This position he resigned in 1904 to enter the college of agriculture of Cornell University as a candidate for the degree of Ph. D., choosing horticulture as a major subject and physiography and soils as minors. Upon receiving the degree in 1906 he served as assistant on the hydrographic survey of Iowa for the United States Geological Survey until receiving his Porto Rico appointment.

The work of Doctor Iorns in Porto Rico had been attended with much success and his death is a distinct loss to the horticultural interests of the island. He had under way a number of promising investigations which were being pursued with great energy and ability. He was joint author with the former horticulturist of a bulletin recently issued by the station on *Pineapple Growing in Porto Rico*, a contributor to the newly established *Porto Rico Horticultural News*, and the author of numerous shorter articles. His short career at the station was characterized by an unselfish devotion to duty and a warm-hearted sympathy with the people for whom he was laboring, which won for him the highest commendation.

**Rhode Island College.**—By a recent act of the general assembly the name of the college has been changed from Rhode Island College of Agriculture and Mechanic Arts to Rhode Island State College. The work on the new dormitory and assembly hall is progressing rapidly, and it is hoped to have the building ready for occupancy in the autumn.

**Tennessee Station.**—L. R. Neel has been appointed assistant in cooperative experiments at Columbia.

**Texas College and Station.**—The legislature has passed a bill establishing four new substations, one to be located in the western part of the State, one in the northwestern portion, one in the black-land belt of the north or central portion, and one in the southern or southeastern portion, together with such other substations as the governing board may determine. The sum of \$25,000 annually for the biennium beginning September 1 has been appropriated for the establishment and maintenance of these substations.

Work has been begun on the new \$35,000 station administration building, and it is expected that this will be completed by September 1. For equipment about \$15,000 will be available from the surplus derived from fees collected under the State feeding stuffs inspection law.

The new engineering building, costing \$65,000, is to be completed about August 1. The departments of civil, electrical, and architectural engineering are to be quartered in this building.

L. L. McInnis, of the board of directors, has been succeeded by A. R. McCollum, of Waco.

**Vermont University and Station.**—M. B. Cummings, a graduate of the university in 1901 and at present assistant in horticulture at Cornell University, has been appointed professor of horticulture in the university and horticulturist in the station, vice William Stuart, whose resignation has been previously noted. H. L. Miner, assistant chemist, has resigned to engage in commercial work.

**Washington College.**—A better-farming special train, sent out March 22-27 through five counties in the eastern part of the State, was visited by nearly

10,000 persons on its trip. W. D. Foster has been promoted to the superintendency of the college farm.

**Wisconsin University.**—The *Student Farmer* announces that the board of regents has recently established two fellowships at \$400 a year and two scholarships at \$225 a year for graduate students in agriculture. These are to be open to graduates of colleges of recognized standing and other students with equivalent education, and both men and women are to be eligible.

**United States Department of Agriculture.**—C. B. Lane, assistant chief of the Dairy Division since 1903, has resigned to accept a position with a large dairy concern in Philadelphia, taking up his new work about June 15.

James B. Rorer, of the fruit disease investigations of the Bureau of Plant Industry, has accepted a two-year appointment as mycologist and pathologist for the Board of Agriculture in Trinidad, and has entered upon his duties.

Dr. C. C. Clark, associate statistician of the Bureau of Statistics, has resigned to become statistician of the International Institute of Agriculture at Rome.

**Fourth Graduate School of Agriculture.**—The fourth session of the Graduate School of Agriculture is to be held during the summer of 1910 at Ames, Iowa, under the auspices of the State College of Agriculture and Mechanic Arts. The school will, as formerly, be under the general management of the Association of American Agricultural Colleges and Experiment Stations through its committee on graduate study, of which Dr. H. P. Armsby has recently been made chairman. Dr. A. C. True, of this Office, has again consented to serve as dean.

**Cuban Experiment Station.**—J. T. Crawley resigned as director May 15. The personnel of the station now includes José G. Couret as vice-director and the following chiefs of departments: Agriculture, J. C. Pagliery; animal industry, Emilio L. Luaces; chemistry, Diego V. Tejeda; vegetable pathology, W. T. Horne; and botany, vacant; and twenty-nine assistants. No provision has been made for continuing the horticultural department. It is reported unofficially that Ramón García Osés has been made director of the station.

**Agricultural and Educational Meetings.**—The twenty-sixth annual convention of the Association of Official Agricultural Chemists is to be held at Denver, Colo., August 26-28, and the meeting of the Association of State and National Food and Dairy Departments is to be at the same place from August 24 to 27. The Society for the Promotion of Agricultural Science is to meet at Portland, Oreg., August 17. The fourth Dry Farming Congress is to meet at Billings, Mont., October 26-28. It is announced that 17 States and 10 foreign countries will be represented by delegates.

The forty-seventh annual convention of the National Education Association is to be held at Denver July 3-9. The programme for the department of rural and agricultural education includes a round table conference on How May the Rural Schools be More Closely Related to the Life and Needs of the People, led by D. J. Crosby, of this Office, and addresses by S. A. Knapp on Agricultural Education for the Rural Districts, E. E. Balcomb on The Type of Farmers' and Teachers' Institutes Used in Oklahoma to Help in Introducing Agriculture and Industrial Work into the Common Schools, H. H. Seerley on National Aid in the Preparation of Teachers of Agriculture for the Public Schools, E. C. Bishop on The Present Status of Agricultural Education in the Public Schools, Josiah Main on Agriculture Correlated with Science Work for High Schools, and Riley O. Johnson on Agriculture for the Elementary Schools. Considerable attention to agricultural education and its interests will also be given in other departments, notably those on normal schools and manual training.

Among the societies to meet with the association are the National Committee on Agricultural Education and the American Home Economics Association.

**Secondary Agricultural Schools in Arkansas.** An appropriation of \$100,000 has been made by the Arkansas legislature for four secondary agricultural schools. The State is to be divided into four districts and the location of the schools will be determined by their respective governing boards.

**Pennsylvania Appropriations for Agricultural Education.**—In addition to the very large appropriations for the Pennsylvania College and Station, noted elsewhere in this issue, the legislature appropriated \$40,000 for the State Forest Academy at Mount Alto and \$25,000 for the National Farm School at Doylestown.

**Proposed Agricultural College in Saskatchewan.**—It is announced that the recently established University of Saskatchewan is to be organized along lines similar to the state universities of this country, and that it will include a college of agriculture. A site has been selected at Saskatoon, about 250 miles north of the Canadian border of Montana, where a tract of nearly 1,200 acres has been set aside for the college farm and campus. The college is to include departments of animal husbandry and veterinary science, field husbandry and soils, farm mechanics, including carpentry, blacksmithing and farm machinery, dairying, horticulture and tree planting, nature study, including biology and geology, chemistry, physics, mathematics, and English. There will also be an extension department, which will take over the work now carried on by the agricultural societies, under the direction of the superintendent of fairs and institutes.

W. J. Rutherford, deputy commissioner of agriculture of the Province of Saskatchewan, has been appointed dean of the college of agriculture, and John Bracken, superintendent of fairs and institutes, as one of the professors. The organization of the college is to proceed at once under their supervision. Buildings of modern type are to be erected ready for occupancy in the fall of 1910, when it is planned to open the institution to students.

**School Gardens for the South.**—H. P. Stuckey, of the Georgia Station, began in the March number of the *Southern Ruralist*, a series of articles on School Gardens for the South. Among the topics so far considered are the educational value of the school garden, seed supplies, the kinds of work especially adapted to the different seasons, and suitable laboratory exercises.

**Miscellaneous.**—The recent death is noted of William H. Council, Ph. D., president of the Agricultural and Mechanical College for Negroes at Normal, Ala., following a long period of ill health.

Dr. Francis Watts, of Antigua, Leeward Islands, has accepted the position of Imperial Commissioner of Agriculture for the West Indies, vice Sir Daniel Morris, whose resignation has been previously noted.

The *Canterbury A. and P. Associations Journal* for April announces the appointment of Robert Alexander as director of the Canterbury Agricultural College, Lincoln, near Christchurch, New Zealand.

A gift of \$100,000 has been made to Yale University by Mrs. Morris K. Jessup to establish the Morris K. Jessup chair of agriculture in the forestry school.

The Order of the Red Eagle, third class, has been conferred upon Prof. O. Kellner, director of the Moeckern Experiment Station.

# EXPERIMENT STATION RECORD.

VOL. XX.

JUNE, 1909.

No. 12.

With the present number the abstract portion of the twentieth volume of *Experiment Station Record* is brought to a close. This portion of the volume contains 1,200 pages, of which 1,054 are devoted to abstracts, 76 to editorials and special articles, and the remainder to station and miscellaneous notes. The customary author and subject indexes will be issued separately somewhat later.

The number of abstracts in the volume is 5,336, which is by far larger than in any previous volume, and nearly 700 in excess of the number in Volume XIX. It is estimated that the preparation of this material involved the review of 40 reports of the American experiment stations, 398 station bulletins and circulars, and 232 publications of this Department, together with the examination of fully 20,000 copies of other publications, including periodicals, books, etc., appearing in twelve or more different languages.

The distribution of the abstracts by subjects was as follows: Agricultural chemistry, 469; meteorology—water, 193; soils—fertilizers, 666; agricultural botany, 176; field crops, 306; horticulture, 223; forestry, 222; plant diseases, 259; economic zoology—entomology, 542; foods—human nutrition, 559; animal production, 383; dairy farming—dairying—agrotechny, 304; veterinary medicine, 475; rural engineering, 97; rural economics, 197; agricultural education, 169; and miscellaneous, 96.

The twenty volumes of the Record thus far issued contain about 71,650 titles, besides editorials, special articles, and notes. The station reports abstracted have numbered 868, the station bulletins and circulars 6,912, and the publications of this Department 3,055.

It is of interest to note that of the total number of abstracts about 36,400, or somewhat more than one-half, have appeared in the eight volumes issued since the publication of the first general index. It is hoped to cover this period by a general index to Volumes XIII–XX in the near future.

## RECENT WORK IN AGRICULTURAL SCIENCE.

### AGRICULTURAL CHEMISTRY.

**Principles and practice of agricultural analysis**, H. W. WILEY (*Easton, Pa.*, 1908, vol. 2, 2. ed. rev. and enl., pp. XI+680, pls. 7, figs. 40).—This is a second revised and enlarged edition of this volume, which deals with fertilizers and insecticides. The preface states that "a great part of the material relating to the occurrence and analysis of ammonia, nitrous and nitric acid printed in the first volume of the first edition of this work has been rewritten and transferred to this volume. . . . All the matter of this volume has been rewritten and brought down to date. New features of moment are those relating to the production of nitric acid for manurial purposes from cyanamid and by direct electric oxidation of the nitrogen of the air. A chapter on the analysis of insecticides has also been added."

Volume 1 of the work has been previously noted (*E. S. R.*, 18, p. 607).

**Report of progress in agricultural chemistry in 1907**, T. DIETRICH ET AL. (*Jahresber. Agr. Chem.*, 3. ser., 10 (1907), pp. XXXV+623).—This volume reviews as usual, by abstract of the more important articles and by title of those of less importance, the published accounts of the work of 1907 in the whole field of agricultural chemistry.

The more important articles on sugar chemistry which have appeared in 1908, E. O. VON LIPPMANN (*Deut. Zuckerindus.*, 33 (1908), Nos. 28, pp. 600-603; 29, pp. 616-617; 30, pp. 636-638; 34 (1909), Nos. 5, pp. 105-107; 6, pp. 124, 125; 7, pp. 142-144; 8, pp. 161, 162).—A digest of recent investigations.

The solubility of lime in water, G. T. MOODY and L. T. LEYSON (*Jour. Chem. Soc. [London]*, 93 (1908), No. 553, pp. 1767-1772, figs. 2; abs. in *Analyst*, 34 (1909), No. 395, p. 72; *Ztschr. Angew. Chem.*, 22 (1909), No. 9, p. 397, fig. 1).—A study of various conditions affecting the solubility of lime in water, which grew out of the observation that the limewater used in volumetric analysis varied very greatly in composition, is reported in this article, and determinations of the exact solubility of lime at temperatures of from 2° to 80° are given.

The decomposition of feldspar by water, W. FUNK (*Ztschr. Angew. Chem.*, 22 (1909), No. 4, pp. 145, 146; abs. in *Jour. Soc. Chem. Indus.*, 28 (1909), No. 4, p. 202; *Jour. Chem. Soc. [London]*, 96 (1909), No. 556, II, p. 146; *Bul. Soc. Chim. France*, 4. ser., 6 (1909), No. 7, p. 491).—Tests showing the ease with which a certain portion of the alkali of even the coarser particles of ground feldspar is extracted by water alone are briefly described.

The different forms of nitrogen in proteins, T. B. OSBORNE, C. S. LEAVENWORTH and C. A. BRAUTLECHT (*Amer. Jour. Physiol.*, 23 (1908), No. 3, pp. 180-200).—As the authors point out, with available means it is not yet possible to determine accurately most of the monoamino-acids obtained in the cleavage of proteids, the results obtained by the methods falling considerably below the actual amount of these amino-acids which are produced by hydrolysis.

The results of an extended study of the determination of basic products of proteid decomposition are reported "which have led us to believe that under

suitable conditions a very considerable degree of accuracy can be obtained in determining ammonia, histidin, arginin, and lysin. We also believe that these determinations afford the best means now available for differentiating the many forms of proteins. . . . The data obtained respecting the determination of ammonia make it highly probable that the results are very accurate, and that this ammonia originates from an amid union in the protein molecule."

Determinations of the actual quantities of histidin, arginin, and lysin present in a number of proteids have shown that the amount of nitrogen contained in these bases corresponds closely with that precipitated by phosphotungstic acid.

"In view of the close agreement between the amount of nitrogen precipitated by phosphotungstic acid and the sum of the nitrogen contained in the arginin, histidin, and lysin which the large number of different proteins from many sources yield on hydrolysis, it seems improbable that other basic products than those just named will be found in the future among the decomposition products of the proteins. In respect to accuracy, the determinations of histidin, arginin, and lysin appear to leave little to be desired if the methods of analysis are carefully and properly carried out.

"It was found that for many proteins a much longer hydrolysis was necessary to liberate all of the bases than has been heretofore supposed. Apparently a considerable part of these bases is present in some of the proteins in very difficultly hydrolyzable combinations which require 24 hours, or more, continued boiling with 25 per cent sulphuric acid for their complete dissolution. This condition was found to hold especially for the proteins of leguminous seeds.

"The wide differences between seed proteins in the proportion of nitrogen precipitated by phosphotungstic acid is chiefly caused by differences in the amount of arginin which was obtained from all of them. This forms about 1 per cent of the protein containing the least, and over 14 per cent of those containing the most, basic nitrogen. The amount of histidin which was also obtained from all of the proteins was nearly the same in the majority of the proteins analyzed, that is, about 2.5 per cent. The amounts of lysin found in the several proteins differed considerably, none being present in any of the alcohol soluble proteins, 4 to 5 per cent in most of the leguminous seed proteins, and over 6 per cent in conalbumen from hen's egg.

"The proteins, when arranged in the order of their yield of arginin, fall into three groups: first the oil seeds, then the leguminous seeds, and finally the cereal grains—the only exception being the glutelin of maize, which is one of the least well characterized and studied of all the proteins in the list, and may be a mixture of several different proteins. . . .

"We have in the chemical constitution of these seed proteins an apparent relationship not only to the biological relations of the plants which produced them, but also to the chemical constitution of the seeds themselves."

Products formed by the decomposition of casein, I. W. BISSEGER and L. STEGMANN (*Ztschr. Physiol. Chem.*, 58 (1908), No. 2, pp. 147–152; *abs. in Jour. Chem. Soc. [London]*, 96 (1909), No. 555, I, p. 72).—Details are given for the isolation of a new basic substance obtained from the lysin fraction. When casein is digested with pancreatin and pepsin in the presence of toluene and sodium fluorid, tetra- and penta-methylenediamins can not be isolated.

On the presence of isoleucin in casein, R. WEITZENBÖCK (*Monatsh. Chem.*, 27 (1906), pp. 831–837; *abs. in Milchw. Zentbl.*, 5 (1909), No. 1, p. 38).—Among the cleavage products in the hydrolysis of casein, the author found leucin, isoleucin, and phenylalanin in the first fraction when precipitated with phosphotungstic acid. These substances were not obtained in the pure state but were always united with aminovaleric acid.

A note on the constitution of phytin, E. WINTERSTEIN (*Ztschr. Physiol. Chem.*, 58 (1908), No. 2, pp. 118-121).—Data on the characteristics of phytin are summarized and the question of its constitution is discussed.

The inversion of cane sugar by invertase, II, C. S. HUDSON (*Jour. Amer. Chem. Soc.*, 30 (1908), No. 10, pp. 1564-1583, figs. 3).—The author points out that the neglect of the mutarotation of the invert sugar in studying the inversion of cane sugar by invertase has led to a series of erroneous conclusions on the laws of the action of this enzyme. The investigations which he reports are a critical contribution to the subject in continuation of work previously noted (E. S. R., 20, p. 611).

Gravimetric determination of nitric acid, A. HES (*Ztschr. Analyt. Chem.*, 48 (1909), No. 2, pp. 81-98; *abs. in Analyst*, 34 (1909), No. 396, pp. 114, 115; *Ztschr. Angew. Chem.*, 22 (1909), No. 15, pp. 684, 685; *Jour. Chem. Soc. [London]*, 96 (1909), No. 557, II, p. 265; *Chem. Zentbl.*, 1909, I, No. 7, p. 579).—A study of the influence of concentration of solution and the presence of various other substances on the accuracy of the determination of nitric acid by means of nitron according to the Busch method (E. S. R., 16, p. 945) is reported.

It was found that this method gives entirely reliable results when used with a 0.1 per cent nitrate solution. With very dilute solutions the nitric acid is not precipitated or only partly precipitated by nitron. Dextrin, gelatin, and perhaps other organic compounds interfere with the crystallization of nitron nitrate. The presence of aluminum sulphate, magnesium sulphate, ammonium sulphate, potassium phosphate, magnesium chlorid, tartaric acid, citric acid, saccharose, and glucose do not interfere with the accurate determination of nitric acid. Higher results are obtained in the presence of oxalic acid. The difference, however, does not correspond to the amount of oxalic acid present, but is very irregular.

Chloric acid is quantitatively precipitated by nitron in the form of nitron chlorate in solutions containing about 0.25 per cent of chloric acid. In solutions which contain both chloric and nitric acids the nitron precipitates both of these acids quantitatively.

Modification of the Kjeldahl method, R. CORRADI (*Indus. Quim.*, 1908, p. 189; *abs. in Ann. Chim. Analyt.*, 14 (1909), No. 1, pp. 29, 30).—A method specially adapted to the analysis of food materials is described. The nitrogen is determined in the Kjeldahl distillate by decomposition with sodium hypobromite and the measurement of the free nitrogen in a Dupré azotometer.

The determination of potash as potassium molybdic phosphate, A. SCHLICHT (*Chem. Ztg.*, 32 (1908), Nos. 93, pp. 1125, 1126; 94, pp. 1138-1140; *abs. in Analyst*, 34 (1909), No. 394, p. 39; *Jour. Chem. Soc. [London]*, 96 (1909), No. 555, II, p. 94).—The method proposed is in brief as follows: Mix 0.1 gm. of potassium sulphate free from ammonium salts with 10 cc. of the author's molybdic reagent and evaporate to dryness. Take up with 10 cc. of hot 5 per cent solution of magnesium sulphate, and when cold collect the precipitate on an asbestos filter, wash first with 10 cc. and then with 5 cc. of 5 per cent magnesium sulphate, and then again three times with 5 cc. of 5 per cent ammonium nitrate, finally with alcohol and ether. Dry or ignite and weigh.

The molybdic reagent is prepared as follows: Dissolve 100 gm. of molybdic acid in water, add 250 gm. of crystallized sodium carbonate, evaporate to dryness, and heat the residue for 2 hours at 150°. Dissolve 500 cc. in water. Dissolve 6 gm. of magnesium pyrophosphate in boiling nitrohydrochloric acid and evaporate repeatedly with nitric acid to expel the chlorine. Dissolve the residue in a little water and nitric acid (specific gravity 1.36) and dilute to 500 cc. with acid of the same strength. To this add gradually and with stirring

the molybdic solution and another 500 cc. of water, and filter after standing for 2 hours.

On the quantitative determination of potash, H. KÜHL (*Pharm. Zentralhalle*, 59 (1909), No. 7, pp. 127-129).—Methods for the determination of potash in potash salts, sludge, and other organic substances are briefly described.

Determination of insoluble phosphoric acid, F. B. CARPENTER (*Jour. Indus. and Engin. Chem.*, 1 (1909), No. 2, p. 119).—Attention is called in this article to the difficulty of securing an ammonium citrate of uniform composition by the official methods.

The determination of phosphoric acid in Thomas slag by weighing the yellow ammonium phosphomolybdate precipitate, Z. ROMÁNSKI (*Chem. Ztg.*, 33 (1909), No. 6, pp. 46, 47, fig. 1; *Ztschr. Angew. Chem.*, 22 (1909), No. 9, p. 400; *abs. in Jour. Chem. Soc. [London]*, 96 (1909), No. 556, II, p. 182; *Chem. Zentbl.*, 1909, I, No. 7, p. 580).—The author reports tests of a modification of the Lorenz method in which the ordinary Wagner molybdic solution is used for precipitation in presence of a mixture of nitric and sulphuric acids (34 cc. of sulphuric acid of 1.84 sp. gr. in 1 liter of nitric acid of sp. gr. 1.2) and the precipitate is finally washed with benzin (sp. gr. 0.64 to 0.7) instead of ether. The results obtained by this method in a large number of determinations were found to agree quite closely with those obtained by the Wagner molybdic method.

Determination of caustic lime, P. PHILOSOPHOFF (*Chem. Ztg.*, 33 (1909), No. 8, pp. 67, 68).—It is maintained that Pöpel's ammonium chlorid method (*E. S. R.*, 20, p. 703) is inaccurate on account of the fact that calcium carbonate will drive off ammonia from ammonium chlorid in warm solution.

Progress report of the committee on standard methods of chemical analysis of water and sewage, E. B. PHELPS ET AL. (*Amer. Jour. Pub. Hyg* 18 (1908), No. 4, pp. 419-424).—This is a summary of information secured from replies to a circular of inquiry. It refers to changes suggested in methods of determining turbidity, free ammonia, organic nitrogen, nitrates, copper, hardness, manganese, hydrogen sulphid, free chlorine, alum, sewage sludge, putrescibility in sewage work, filter control, and field assay of water.

The examination of waters in place, H. KLUT (*Untersuchung des Wassers an Ort und Stelle*. Berlin, 1908, pp. VII+159, figs. 29).—This is a revision and enlargement of an article first published in *Pharmazeutischen Kalender*, 1908. It gives plain directions for the taking of samples and for quickly testing temperature, turbidity, color, organic matter, smell, taste, nitrous and nitric acids, ammonia compounds, hardness, reaction, bacteriological character, iron, free carbon dioxide, dissolved oxygen, lead, and manganese.

Detection and determination of nitrates and nitrites in water, TABUTEAU (*Arch. Méd. Angers*, 1908, Sept. 20; *abs. in Ann. Chim. Analyt.*, 14 (1909), No. 1, pp. 17-19).—Various methods which are available for detecting and determining nitrites and nitrates together and nitrites alone are discussed.

A new method of detecting nitrites in drinking water, A. ROCHAIX (*Compt. Rend. Soc. Biol. [Paris]*, 66 (1909), No. 4, pp. 171, 172).—The method proposed is based upon the blue coloration produced when a solution of toluylene red is added to water containing nitrous acid.

The estimation of urea in urine, S. R. BENEDICT and F. GEPHART (*Jour. Amer. Chem. Soc.*, 30 (1908), No. 11, pp. 1760-1764).—In the proposed method of the estimation of urea in urine, 5 cc. of urine and an equal volume of dilute hydrochloric acid (1 volume acid to 4 distilled water) are mixed in a wide test tube with the top covered by folding a piece of lead foil over it, and placed in a small autoclave heated to a temperature of 150° to 155° C. for about 1½ hours.

After cooling, the contents of the test tube are washed into a flask, diluted to about 400 cc., treated with 20 cc. of 10 per cent sodium hydroxid solution, and distilled for about 40 minutes into an excess of standard acid. The residue is determined and the urea nitrogen calculated after subtracting the previously determined ammonia nitrogen.

The author reports determinations which in his opinion show that the method is accurate.

The determination of total sulphur in urine, F. W. GILL and H. S. GRINDLEY (*Jour. Amer. Chem. Soc.*, 31 (1909), No. 1, pp. 52-59).—A critical study of the sodium peroxid method for the determination of total sulphur in urine, which according to the authors shows a loss of sulphur when such methods are used "and probably in fact where any alkaline fusion methods are used. . . . Experiments are now being made in this laboratory to determine the nature and extent of the losses, if any, occurring in the determination of sulphur in foods and feces. Results so far obtained show that the determination of the total sulphur in foods and feces by the method of procedure usually employed in the determination of total sulphur in urines gives fusions which more or less frequently evolve hydrogen-sulphid gas upon being acidified."

The identification of horse meat by the biological method, E. BAIER and E. REUCHLIN (*Ztschr. Untersuch. Nahr. u. Genussmtl.*, 15 (1908), No. 9, pp. 513-520).—On the basis of their investigations the authors conclude that this method is satisfactory for the detection of horse meat in dried sausage.

The identification of horse meat in sausage, A. BEHRE (*Ztschr. Untersuch. Nahr. u. Genussmtl.*, 15 (1908), No. 9, pp. 521-526).—According to the author's studies, the chief difficulty in applying the biological method is the preparation of a suitable antiserum.

The accumulation of tyrosin in preserved liver, A. BEHRE (*Ztschr. Untersuch. Nahr. u. Genussmtl.*, 15 (1908), No. 9, pp. 525, 526).—The presence of free tyrosin in preserved liver indicates decomposition and goods showing it should not be offered for sale.

The determination of malic acid in food products, H. W. COWLES, JR. (*Jour. Amer. Chem. Soc.*, 30 (1908), No. 8, pp. 1285-1288; *abs. in Chem. Abs.*, 3 (1909), No. 1, p. 83).—A critical study of methods.

The estimation of tartaric acid in the presence of malic and succinic acids, L. GOWING-SCOPES (*Analyst*, 33 (1908), No. 389, pp. 315-319).—A critical study of methods.

The determination of boric acid with iodine, M. L. BARTHE (*Proc. Verb. Soc. Sci. Phys. et Nat. Bordeaux*, 1906-7, pp. 41, 42).—The author believes that under the usual laboratory conditions it is not possible to determine boric acid satisfactorily with iodine in the presence of glycerin and mannite.

Résumé of the work of the International Commission for Uniform Methods of Sugar Analysis, E. G. WIECHMANN (*Internat. Sugar Jour.*, 11 (1909), No. 123, pp. 124-133).—A digest of data.

History, manufacture, and analysis of maple products, A. P. SY (*Jour. Franklin Inst.*, 166 (1908), pp. 249-280; *abs. in Chem. Abs.*, 2 (1908), No. 24, p. 3376).—The history of maple sugar making, the botanical classification and distribution of sugar maple, the physiology of sap flow, and other similar matters are discussed and an account of the development of processes for the manufacture of maple products is given. The analysis of maple products is also considered, and experimental work carried on in an attempt to isolate flavoring substances present in maple sap is described.

The lead value of maple products, A. P. SY (*Jour. Amer. Chem. Soc.*, 30 (1908), No. 10, pp. 1611-1616; *abs. in Chem. Abs.*, 2 (1908), No. 24, pp. 3376, 3377).—By lead value is meant the amount of lead in grams found in the pre-

precipitate formed by adding neutral lead acetate to 100 gm. maple sugar or 100 cc. sirup. Investigation showed that concordant results can be obtained if the method is followed closely, and pure and adulterated products are readily differentiated.

The method is as follows: To 50 gm. sugar, or 50 cc. sirup, add 200 cc. water, heat to boiling, add 20 cc. of a 10 per cent solution lead acetate (neutral), cover, heat again to boiling, let stand till cold, filter, and wash with 100 cc. water. Transfer filter and precipitate to a 400 cc. beaker and digest with 15 cc.  $\text{HNO}_3$  and 10 cc.  $\text{HCl}$  until colorless; cool, add 10 cc.  $\text{H}_2\text{SO}_4$ , heat to fumes; cool, add 50 cc. water and 100 alcohol; determine  $\text{PbSO}_4$ , as usual.  $\text{PbSO}_4 \times 1.366 = \text{lead value}$ , which should be not less than 0.250 and is usually over 0.300 for pure maple products.

The results of determinations made with 80 samples are given. See also a previous note (E. S. R., 18, p. 525).

The colorimetric estimation of benzaldehyde in almond extracts, A. G. WOODMAN and E. F. LYFORD (*Jour. Amer. Chem. Soc.*, 30 (1908), No. 10, pp. 1607-1611).—An adaptation of the fuchsin sulphurous-acid method to the estimation of small amounts of benzaldehyde is described.

"A number of test analyses have demonstrated the accuracy of the method and its convenience in the assay of commercial almond extracts. It is probable that it could be applied also to the valuation of almond oils."

The determination of aldehydes in oil of lemon, A. H. BENNETT (*Analyst*, 34 (1909), No. 394, pp. 14-17).—A study of methods.

The detection of caramel in vanilla extract, A. G. WOODMAN and E. H. NEWHALL (*Tech. Quart.*, 21 (1908), No. 3, pp. 280-287; *Chem. Abs.*, 3 (1909), No. 1, p. 86).—Comparative tests of pure and specified vanillas showed that the use of absorptive reagents such as fuller's earth, or the removing of the natural color by selective solvents, is of little value. The best results are obtained with phenylhydrazin and paraldehyde.

A color reaction for mustard, T. MERL (*Ztschr. Untersuch. Nahr. u. Genussmtl.*, 15 (1908), No. 9, pp. 526, 527).—Note on the detection of curcuma and coal-tar dyes in mustard.

A doubtful color reaction, T. MERL (*Ztschr. Untersuch. Nahr. u. Genussmtl.*, 15 (1908), No. 9, pp. 528, 529).—Note on mustard analysis.

Decree relating to methods for analysis of wines, alcohol, brandies, and liqueurs (*Bul. Mens. Off. Renseign. Agr. [Paris]*, 7 (1908), No. 5, pp. 522, 523).—Official methods are prescribed for determining the dry extract at 100° of ordinary wines and for the determination of impurities of alcohols, brandies, and liqueurs in accordance with the law of August 1, 1905.

Analysis of milks, G. HINARD (*Analyse des Laites. Paris*, [1909], pp. 190, figs. 6).—This handbook was written for the dairy chemist. Methods for the physical examination and the chemical analysis of normal and adulterated milks are described.

On the testing for ferments, especially in milk, S. ROTHENFUSSER (*Ztschr. Untersuch. Nahr. u. Genussmtl.*, 16 (1908), No. 1-2, pp. 63-74).—The author reviews the various methods which have been proposed for ascertaining whether or not milk has been heated, and classifies them as follows: (1) Those which precipitate casein and fat by various agencies, (2) tests for oxidases, (3) tests for substances which decompose hydrogen peroxid, and (4) tests for reductases. There are also physical methods which are at present of little practical value. The methods included under (2) and (3) are more rapid than the others. Zink and Siegfeld's method of using gualac is recommended. A modification of the Storch method is outlined, which can be used when various preservatives have been added to the milk.

On milk judging, H. R. CHRISTENSEN (*Tidsskr. Landökonomi*, 1908, Nos. 11, pp. 555-560; 13, pp. 690-692).—This paper contains a discussion of the reductase test as to the purity and keeping quality of milk, originally proposed by Neisser and Wechsberg. The results obtained by Barthel (*E. S. R.*, 20, p. 12) are quoted at length.

A new reaction differentiating raw milk from heated (pasteurized) milk, as well as for the detection of hydrogen peroxid, W. P. WILKINSON and R. C. PETERS (*Jour. Dept. Agr. Victoria*, 6 (1908), No. 4, pp. 251-253; *Ztschr. Untersuch. Nahr. u. Genussmtl.*, 16 (1908), No. 3, pp. 172-174; *abs. in Rev. Gén. Lait*, 7 (1908), No. 7, p. 162).—This is a critical review of the methods which have been suggested for this purpose.

The authors also give the results of their experiments with benzidin according to the following method: "To 10 cc. of the milk to be tested are added 2 cc. of an alcoholic solution of benzidin, then 2 to 3 drops of glacial acetic acid (just sufficient to cause coagulation of the milk), shake the whole, and finally add 2 cc. of a 3 per cent solution of hydrogen peroxid. If the milk is unboiled or if it has not been heated to above 78° C., an intense blue coloration is immediately produced. Milk which has been heated to above 80° does not show any change by this treatment."

The advantages of using the benzidin test are that the reaction is more reliable than either the guaiac or potassium-iodid test, and more sensitive and intense than the paraphenylendiamin test. The reagent is also cheap and will keep for a long time. "The usefulness of benzidin as a test for unboiled milk may be extended by reversing the reaction and applying it as a very sensitive test for hydrogen peroxid."

The freezing point of milk as affected by the addition of water, P. FISCHER (*Pharm. Ztg.*, 53 (1908), No. 5, pp. 48, 49).—The author found the freezing point of 100 samples of milk to vary from -0.54 to -0.58° C. Whenever water was added the freezing point was raised, and he concludes that the freezing point of milk will vary according to the percentage of water added to it.

The freezing point of milk, W. R. G. ATKINS (*Chem. News*, 97 (1908), No. 2530, pp. 241, 242; *Dairy*, 20 (1908), No. 237, p. 238; *abs. in Analyst*, 33 (1908), No. 388, p. 279).—The author found the mean freezing point of milk to be -0.55° C. and fairly constant, the variations rarely exceeding 0.03°. If milk is skimmed the specific gravity will be too high, but the freezing point will be unaffected, as fats have no effect on the freezing point. If water is added to bring the specific gravity to the correct value, the freezing point will be nearer that of pure water.

A contrivance for the determination of fat in milk by the Gottlieb-Röse method, E. RIETER (*Schweiz. Wehnschr. Chem. u. Pharm.*, 44 (1906), No. 12, pp. 170-172, fig. 1; *Ann. Chim. Analyt.*, 14 (1909), No. 2, pp. 54-57, fig. 1).—This is a description of a tube used in the author's modification of the Gottlieb-Röse method of determining the fat content.

The determination of fat in skim milk, R. LEZÉ (*Ann. Chim. Analyt.*, 13 (1908), No. 5, pp. 179, 180; *abs. in Ztschr. Untersuch. Nahr. u. Genussmtl.*, 16 (1908), No. 11, p. 701).—The author adds ammonia and sodium hydroxid to skim milk, which is then centrifuged and the portion containing the fat tested as in the case of whole milk.

A study of the Lezé process for the analysis of skim milk, R. LEZÉ, BOUTINES, and DUFLOS (*Rev. Gén. Lait*, 7 (1909), No. 9, pp. 193-197).—In order to overcome the variable results obtained in some cases by the Lezé method, noted above, the authors point out the conditions requisite for accurate determinations with this method.

**A rapid method for the detection and estimation of formaldehyde in milk,** H. S. SHREWSBURY and A. W. KNAPP (*Analyst*, 34 (1909), No. 394, pp. 12-14).—This is a paper presented at the meeting of the Society of Public Analysts and other Analytical Chemists at London, December 2, 1908.

The reagent used by the authors is made up of 1 cc. of pure nitric acid added to 100 cc. of hydrochloric acid. To 5 cc. of milk in a test tube 10 cc. of the freshly made reagent is added, shaken vigorously, and kept for 10 minutes in a water bath at 50° C. A violet color appears if formaldehyde is present and its intensity indicates the amount.

**Disadvantages of potassium bichromate as a preservative,** A. MONVOISIN (*Compt. Rend. Acad. Sci. [Paris]*, 147 (1908), No. 25, pp. 1403, 1404; *abs. in Jour. Soc. Chem. Indus.*, 28 (1909), No. 1, p. 36).—The French law of August 1, 1905, requires that potassium bichromate be added to samples of milk taken for analysis. The author finds that after such addition the Storch test for heated milk can not be used. Potassium bichromate also interferes with the determination of the acidity, the cryoscopic point, the refractive index, and probably also the detection of formaldehyde.

**The determination of the moisture content of butter,** F. BENGEN (*Ztschr. Untersuch. Nahr. u. Genussmtl.*, 15 (1908), No. 10, pp. 587-594; *abs. in Hyg. Rundschau*, 19 (1909), No. 1, p. 36).—From a study of other investigators and his own experience in determining the moisture content of butter by drying in a Soxhlet apparatus, the author concludes that the present methods of determination by drying are not reliable, since some of the fatty acids are volatile and the result will be too high. The indirect method of subtracting the fat plus the solids-not-fat from 100 is recommended.

**Studies on fatty acids in butter,** R. K. DONS (*Ztschr. Untersuch. Nahr. u. Genussmtl.*, 16 (1908), No. 12, pp. 705-725, *dgms.* 2).—Continuing the researches previously noted (E. S. R., 19, p. 1111), the author has improved the methods for determining the amount of caproic, lauric, myristic, and other fatty acids of butter, which he describes in this article.

**The Müntz-Coudon number in butters from the vicinity of Pavia,** N. MONTI (*Staz. Sper. Agr. Ital.*, 41 (1908), No. 5-6, pp. 270-282).—The author used the Müntz-Coudon modification of the Polenske method in an examination of 76 samples of butter as to adulteration with other fats. A butter having a higher number than 13.36 is deemed free from coconut fat.

**Artificial means of increasing the Reichert-Meissl value and saponification value of butter fat,** H. FINCKE (*Ztschr. Untersuch. Nahr. u. Genussmtl.*, 16 (1908), No. 11, pp. 666-673; *abs. in Analyst*, 34 (1909), No. 395, pp. 50, 51).—The author describes methods for the determination of acetin and triacetin when it is suspected that oils containing these glycerids have been added to fats for the purpose of imitating butter.

**The determination of sugar in molasses feeds by polarization,** F. HERLES (*Ztschr. Zuckerindus. Böhmen*, 82 (1908), No. 11, pp. 626-628).—The author describes a method of determining the sugar content in molasses feeds which he has successfully used for the past 10 years.

**Rapid determination of oil in cotton-seed products,** C. H. HERTY, F. B. STEM, and M. ORR (*Jour. Indus. and Engin. Chem.*, 1 (1909), No. 2, pp. 76-81).—In this article the objections to the usual methods are enumerated and a new method is described, in which the objections are said to be met.

**The higher melting point constituents of Japanese fish oil,** H. OKADA (*Chem. Ztg.*, 32 (1908), No. 99, pp. 1199-1201, *figs.* 2; *abs. in Analyst*, 34 (1909), No. 395, p. 62). A fish oil derived from several species of herring was found to have a melting point of 34 to 35° C. The saponification value was 195.9, the

iodin value was 29.7, and the refractometer reading at 41 to 42° C. was 1.4545. The oil was found to contain oleic acid and solid acids which appeared to be a mixture of stearic and isocetic acids.

Detection of savin oil, A. BEYTHIEN and P. ATENSTÄDT (*Ztschr. Untersuch. Nahr. u. Genussmtl.*, 16 (1908), No. 11, pp. 677-679; *abs. in Analyst*, 34 (1909), No. 395, pp. 63, 64).—A note on methods for differentiating between savin oil, juniper oil, and turpentine.

Characteristics of ergot and lycopodium oils and areca-nut fat, A. RATHJE (*Arch. Pharm.*, 246 (1908), No. 9, pp. 692-709; *abs. in Analyst*, 34 (1909), No. 395, p. 64).—Analytical data are given on these oils.

[Miscellaneous analyses], H. E. ANNETT (*Ann. Rpt. Dept. Agr. Bombay*, 1907-8, pp. 27-31).—This is the annual report of the official chemist and contains analyses of milk, cream, oil seeds, and other agricultural products.

[Miscellaneous analyses], J. GRAFTIAU (*Rap. Lab. Anal. Louvain*, 1906, pp. 17; 1907, pp. 16).—These are the annual reports of the official chemist and contain analyses of fertilizers, feeding stuffs, and agricultural products.

[Miscellaneous analyses], T. F. SEDGWICK (*Mem. Dir. Fomento [Peru]*, 1907-8, vol. 1, pp. 53-101).—This is the annual report of the sugar cane experiment station for the year ending March 31, 1908. During the year 447 samples of soils, fertilizers, sugars, and other agricultural materials were analyzed.

[Miscellaneous analyses], J. McCRAE (*Transvaal Govt. Labs. Ann. Rpt.* 1907-8, pp. 5-21).—This is the annual report of the government analyst and contains analyses of milk, meal, flour, water, and other agricultural materials.

### METEOROLOGY—WATER.

Introduction to weather forecasting, W. J. VAN BEBBER (*Anleitung zur Aufstellung von Wettervorhersagen. Brunswick*, 1908, 2. rev. ed., pp. VI+38, figs. 16; *rev. in Beibl. Ann. Phys.*, 33 (1909), No. 5, pp. 306, 307).—A second revised edition of this pamphlet, which contains a brief popular discussion of the subject for the use of schools and farmers.

Constantly appearing secondary maxima and minima in the yearly course of meteorological elements, VAN RIJCKEVORSEL (*Konstant auftretende sekundäre Maxima und Minima in dem jährlichen Verlauf der meteorologischen Erscheinungen. Rotterdam*, 1908, pt. 5, pp. 14, fig. 1, charts 3; *rev. in Beibl. Ann. Phys.*, 33 (1909), No. 5, p. 306).—Temperature, pressure, and rainfall curves are traced and discussed.

The isothermal layer of the atmosphere and atmospheric radiation, E. GOLD (*Proc. Roy. Soc. [London]*, Ser. A, 82 (1909), No. A551, pp. 43-70).—The topics treated in this article are the phenomenon of the isothermal layer and the experimental evidence of its existence; the possible temperature distributions in an atmosphere; experimental data on gaseous radiation and absorption; and general expressions for the radiation from the atmosphere and conditions of its equilibrium as applied to an atmosphere of uniform constitution, the earth's atmosphere, taking into account the diminution of water vapor with height, and the day and night temperatures of the earth's surface.

The isothermal layer of the atmosphere, J. I. CRAIG, W. H. DINES, R. H. HUGHES, and E. GOLD (*Nature [London]*, 78 (1908), No. 2031, pp. 550-552; 79 (1909), Nos. 2045, pp. 281, 282; 2047, pp. 340, 341; 80 (1909), No. 2055, p. 68).—The paper noted above is briefly discussed in this series of articles.

Recent observations in atmospheric electricity, P. H. DIKE (*Amer. Jour. Sci.*, 4. ser., 27 (1909), No. 159, pp. 197-209).—This is a paper presented before the Philosophical Society of Washington and is a critical review of recent work of investigators in this great field, which is said to be almost entirely neglected in this country.

The origin of atmospheric ozone and the causes of variation of carbon dioxid in the air, H. HENRIET and M. BOUYSSY (*Ann. Observ. Munic. (Observ. Montsouris) [Paris]*, 9 (1908), No. 1-2, pp. 167-195).—This is a detailed account of investigations, a brief report of which has already been noted (E. S. R., 20, p. 422).

Analyses of air, P. MIQUEL (*Ann. Observ. Munic. (Observ. Montsouris) [Paris]*, 9 (1908), No. 1-2, pp. 7-28).—Numerous determinations of ozone and carbon dioxid in the free air and more detailed examinations of the confined air of subways, tunnels, and buildings are reported.

[Meteorological observations in Trinidad], J. H. HART and H. MILLEN (*Bot. Dept. Trinidad Ann. Rpt. 1908*, pp. 24, 25, 32-37).—Tables are given which show the monthly and annual rainfall at the Royal Botanic Gardens from 1862 to 1907; mean annual barometric pressure, temperature, and rainfall at the same place, 1888 to 1907; and observations on rainfall during 1907 at 56 stations in Trinidad; besides miscellaneous meteorological observations during that year at various stations in the island. The mean annual rainfall at the botanic gardens, 1862 to 1907, was 72.39 in.; for 20 years, 1888 to 1907, 66.6 in. The mean barometric pressure for the 20 years, 1888 to 1907, was 29.96 in.; the annual temperature 78.50.

The rainfall in Natal, E. NEVILL (*Natal Agr. Jour.*, 11 (1908), No. 12, pp. 1531-1533).—Attention is called to the fact that there is a distinct 18-year periodical fluctuation in rainfall in Natal, the epochs of heaviest rainfall centering around the years 1855-56, 1873-74, and 1892-93. The indications point to a similar exceptionally heavy rainfall centering around the year 1910-11. The excess of rain is usually spread over a period of about 5 years. These periods of excessive rainfall are attributed to the gradual northerly drift of the great rain belt, the normal position of which is to the southeast of Cape Colony.

It is noted also that these epochs of heavy rainfall coincide "with that of the approach of the node of the moon's orbit to the position of the vernal or spring equinox, when the inclination of the plane of the moon's orbit to the plane of the terrestrial equator reaches its maximum value, as if there were some connection between the two occurrences, and this coincidence points to a possible cause of this 18-year fluctuation in the rainfall. . . . If the great rain belt has any tendency to follow the deformation of the atmosphere under the attraction of the moon, as it should according to theory, then the greatest northerly drift will occur when the moon's node approaches the vernal equinox, and this is exactly what is indicated by the observations. It is to be noted that this is purely a local cause affecting Southeast Africa, and not necessarily holding of any other place. . . .

"It is noteworthy that three 11 or 12 year solar periods of variation in density of rain belt are not very different from two 18-year lunar periods, so that every 35 or 36 years the two should coincide and give rise to a specially heavy excess of rain, similar to that which is recorded by the observations. Thus the excess of rainfall near 1855-56 and 1892-93 was much heavier than that at the intermediate 18-year epoch in 1873-74. If this be so, the coming heavy rains of 1910-11 will not be so heavy as those of either 1855-56 or 1892-93."

Contributions to hydrology, H. DESSOLLIERS (*Contributions Diverses à l'Hydrogène. Algiers*, 1908, pp. 168, pls. 4, figs. 4).—This is a series of articles treating of sources and means of conserving and increasing the water supply.

Underground waters of Georgia, S. W. McALLIE (*Geol. Survey Ga. Bul.* 15, pp. 370, pls. 29, figs. 5, map 1).—This report has an introductory chapter on the general conditions controlling the amount of water taken up by soils, discusses briefly the physiography and geology of Georgia, and takes up in detail

the amount, composition and other characteristics of the underground water by geological formations and by counties. The report is in part a revision of a paper on the artesian well system of Georgia, published in 1898.

Dew ponds, G. HUBBARD (*Jour. Roy. Soc. Arts*, 57 (1909), No. 2937, pp. 330-340).—The article tells what dew ponds are, explains the conditions essential to their efficient action, and discusses the possibility of their introduction with advantage into arid regions. Accurate data are too limited to draw positive conclusions as to the latter point. See also a previous note (E. S. R., 17, p. 533).

A phase of ground water problems in the West, W. C. MENDENHALL (*Econ. Geol.*, 4 (1909), No. 1, pp. 35-45, figs. 2).—This article is based upon observations on "the relation of the withdrawals of ground water by artificial means to the recharge from precipitation and run-off" in the San Bernardino Valley, California, "where, during 8 or 9 years past, the total developed waters and the total waters that rise naturally in springs have been measured twice annually. The total water from both these sources, all of which is used for domestic purposes or for irrigation, has increased slowly, although irregularly, to keep pace with the increasing population of the dependent communities, but the most striking fact brought out by the measurements is the general increase in the amount of developed water, accompanying an equally marked general decrease in the natural waters; that is to say, the flow of springs has lessened markedly as the yield of wells has increased. . . .

"Detailed measurements have not been made for other of the many basins that together constitute the valley of southern California, but there is no doubt that were they to be had they would indicate about the same condition that exists in the San Bernardino basin."

The need of "constant records of fluctuations in ground water levels, for comparison with the average rainfall, or the average flow of the supplying stream," is emphasized.

The presence of nitrites and ammonia in drinking water, S. VAN EYK (*Pharm. Weekbl.*, 45 (1908), No. 41, pp. 1162-1165; *abs. in Chem. Abs.*, 3 (1909), No. 6, p. 682).—The occurrence of considerable amounts of nitrites in water from a zinc-lined pump is reported. An investigation of the matter indicated that the nitrites were due to the reduction of nitrates by the zinc.

The removal of iron from well water, PETERS (*Ztschr. Hyg. u. Infektionskrank.*, 61 (1908), No. 2, pp. 247-261; *abs. in Chem. Abs.*, 3 (1909), No. 6, p. 682).—The method proposed is to pour into the well water which has been standing for some time in the open air and has become thoroughly aerated. The iron is precipitated by the oxygen thus introduced and the water may be pumped out and filtered.

The purification of ground waters containing iron and manganese, R. S. WESTON (*Proc. Amer. Soc. Civ. Engin.*, 34 (1908), No. 10, pp. 1324-1393, pls. 3, figs. 8; 35 (1909), No. 2, pp. 150-166, fig. 1; *abs. in Engin. Rec.*, 59 (1909), No. 6, pp. 146-148, fig. 1; *Engin. Digest*, 5 (1909), No. 3, pp. 251-256).—This article explains that the method of deferrization which it is advisable to use in any given case depends upon the composition and character of the water. A careful study of the water is therefore a necessary preliminary to the application of efficient methods. Methods which have been employed with success are described. The most important feature of all of these methods is thorough aeration.

Chemical purification of drinking water in the country, J. LAURENT (*Jour. Pharm. et Chim.*, 6. ser., 28 (1908), No. 9, pp. 392, 393; *abs. in Rev. Sci. [Paris]*, 47 (1909), 1. No. 5, p. 150).—Directions are given for the application of a method based upon the use of permanganate of potash and alum followed by the addition of sodium hyposulphite and carbonate.

The recent Parisian experiments on water sterilization by ozone, C. DAAGE (*Engin. Rec.*, 59 (1909), No. 7, p. 183).—Experiments with Siemens-de Frise ozonizers are reported. The treatment was found to be very effective in destroying organisms in the water.

On the sterilization of potable water by means of the mercury vapor lamp, J. COURMONT and T. NOGIER (*Compt. Rend. Acad. Sci. [Paris]*, 148 (1909), No. 8, pp. 523, 524).—Experiments are reported which show that by the use of the Kromayer mercury vapor lamp complete sterilization can be secured in from 1 to 2 minutes, even when the samples are very highly polluted.

Examinations of water, P. MIQUEL (*Ann. Observ. Munic. (Observ. Montsouris)* [Paris], 9 (1908), No. 1-2, pp. 29-62).—Detailed examinations of potable waters of Paris and environs, sewage and drainage waters, and rain water are reported.

## SOILS—FERTILIZERS.

The soil, A. D. HALL (*London*, 1908, 2. ed., rev. and enl., pp XV+311, pls. 13, figs. 4).—This is a second revised and enlarged edition of this work, which is described as an introduction to the scientific study of the growth of crops. The principal changes which have been made are a revision of the method of mechanical analysis of soils, modification of the author's views on the nature of clay and on the absorption of ammonium and other salts by zeolitic silicates in the soil, and enlargement and complete revision of the chapter on the living organisms of the soil, besides numerous minor corrections and modifications.

The genetic classification of soils, N. TULAIOV (*Jour. Agr. Sci.*, 3 (1908), No. 1, pp. 80-85).—This is a brief description of the genetic classification of soils as worked out by Dokouchayev and Sibertzev in Russia (*E. S. R.*, 12, pp. 704, 807; 19, p. 314) and partially adopted by Hilgard and Ramann.

In this classification the word soil is taken to mean "the loose surface strata of the earth's crust in which general dynamic processes (weathering, erosion, etc.) have taken place, and are taking place in conjunction with chemico-biological processes." The classification includes 7 types, as follows: Laterite soils, wind-blown loess soils, soils of the dry steppe, black soils (chernozem), gray soils, peat and ashy (podzol) soils, and fenland (tundra) soils. These 7 fundamental groups of soils "are spread over the surface of large continents in zones which coincide with the physico-geographical zones of those continents."

It is stated that notwithstanding the seeming complexity of this classification, "its fundamental feature is the general statement that soil is the product of the conditions of its development, and that the peculiarities of soils are closely interrelated."

Soil investigations, I, K. O. BJÖRLYKKE (*Tidsskr. Norske Landbr.*, 15 (1908), No. 11, pp. 496-504).—A discussion of the principles underlying the problem of soil studies. In this article considerable attention is given to American work in this line, particularly to that of Hilgard.

Biochemical studies in forest soils, R. ALBERT and A. LUTHER (*Jour. Landw.*, 56 (1908), No. 4, pp. 347-370; *abs. in Chem. Zentbl.*, 1909, I, No. 7, p. 572).—The studies, which were made with four diluvial forest soils, included determinations by Remy's method of putrefactive capacity under different conditions of season and water supply, nitrifying power by the Buhlert and Fickendey method, fermentative power for soluble carbohydrates by the Remy method, and physical and chemical examinations of the soils. The studies reported are considered preliminary to further investigations and therefore few con-

clusions are drawn. The results in general indicate the usefulness of Remy's methods of study.

A certain parallelism was observed to exist between biological activity and the carbohydrates, lime, mineral matter, and fine particles of the surface soil. The character of the humus appeared to be of more importance than its total amount. Determinations of absorptive power for nitrogen according to Knop's method and of hygroscopicity according to Mitscherlich's method proved of value in judging the character of the soils. Determinations of free acids in humus by Süchting's method were found to be of little value.

Chemico-agricultural study of the soils of Poggiomarino, S. DE GRAZIA (*Ann. R. Scuola Sup. Agr. Portici*, 2. se., 7 (1907), pp. 26).—Poggiomarino is a district in the province of Naples, its soils being of volcanic origin. The mechanical analysis, litho-mineralogical analysis of the coarse material, physico-chemical analysis (Schloesing), and a brief chemical analysis of soil from seven points in the region are given and discussed at considerable length. In general the soil of the region may be classified as fertile.

A remarkable accumulation of nitrogen, carbon, and humus in a prairie soil, F. J. ALWAY and C. E. VAIL (*Jour. Indus. and Engin. Chem.*, 1 (1909), No. 2, pp. 74-76).—Analyses of 2 types of soil, bowlder clay and lacustral clay, from the experimental farm at Indian Head are reported. The samples of lacustral clay were taken from the summits of hummocks which are a characteristic feature of the area under consideration, as well as from rifts between the hummocks. No marked difference was observed in the composition of the till and the soil from the summits of the hummocks. The rifts, however, contained more than twice as much humus (7.18 per cent), humus nitrogen (0.46 per cent), total nitrogen (0.84 per cent), and carbon (10.59 per cent) as the soil from the tops of the hummocks.

Soil acidity in its relation to lack of available phosphates, C. W. STODDART (*Jour. Indus. and Engin. Chem.*, 1 (1909), No. 2, pp. 69-74; *abs. in Jour. Soc. Chem. Ind'is.*, 28 (1909), No. 6, p. 320).—In a previous paper (*E. S. R.*, 18, p. 1024; 19, p. 17) it was shown that acid soils are as a rule in need of phosphates.

Further study of typical acid and neutral soils, more particularly the relation of phosphoric acid to humus, showed that the phosphoric acid content of the humus was about the same in both acid and nonacid soils. The acid soils contained a higher percentage of total phosphoric acid in combination with iron and aluminum and less in combination with calcium than the nonacid soils.

Some of the results obtained indicate that the phosphorus of humus may not be available to plants. Fifth-normal nitric acid was found to be an excellent indicator of soil needs with respect to phosphates, due to the fact that it determines with accuracy the amount of calcium phosphate in soils. The general conclusion is reached that as far as Wisconsin soils are concerned, when the percentage of phosphoric acid soluble in fifth-normal nitric acid falls below 0.015 the soils will respond to phosphate fertilizer.

The problem of our unproductive lands, T. CHERRY (*Jour. Dept. Agr. Victoria*, 7 (1909), No. 1, pp. 18-25).—The lands referred to include "first approximately 4 million acres of the inferior and poor parts of the Mallee; second, at least double that area of hilly country forming the main part of the Great Dividing Range and its northern and southern spurs; and third, perhaps million acres of the sandy land along the coast. The total area is at least one-fourth of the entire extent of Victoria."

The composition of the soil of these areas as compared with that of other parts of Victoria is shown in the following table:

*Results of analyses of Victorian soils.*

	Nitrogen.	Phosphoric acid.	Potash.
	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>
Rich western district land.....	0.250	0.150	0.300
Average northern wheat land.....	.110	.065	.300
Average coastal plain land.....	0.040-.350	0.010-.100	0.010-.150
Average hill soils.....	.025-.150	.040-.080	.100-.300
Average Mallee soils.....	.025-.200	.005-.100	.200-1.000

One prominent physical characteristic of these soils is the very slight difference between surface soil and subsoil. Potash is as a rule very abundant in the soils and nitrogen is generally fairly abundant, but phosphoric acid is deficient. Lime is a prominent constituent, in many cases running as high as 10 to 25 per cent. Practical trials indicate that the use of manure and phosphates and thorough cultivation are among the most efficient means of improving these soils.

On the effect of various mulching materials on the productiveness of soils, CLAUSEN (*Illus. Landw. Ztg.*, 28 (1908), No. 99, p. 846; *abs. in Chem. Abs.*, 3 (1909), No. 6, p. 684).—Comparative tests of sand, peat, and sawdust are reported. It was found that the use of an amount of peat corresponding to only 1.6 per cent of the amount of soil increased the yield about 25 per cent.

Fixation of free nitrogen, nitrification, etc., A. KOCH (*Jahresber. Gärungs-Organismen*, 16 (1905), pp. 352-389).—This is a review of investigations reported during 1905 on fixation of free nitrogen, denitrification, nitrification, and related subjects, more particularly fermentative changes occurring in manure.

Contribution to the knowledge of the chemical processes involved in the assimilation of free nitrogen by *Azotobacter* and *Radiobacter*, J. STOKLASA ET AL. (*Centbl. Bakt. [etc.]*, 2 Abt., 21 (1908), Nos. 15-16, pp. 484-509; 20-21, pp. 620-632, pls. 3; *abs. in Jour. Chem. Soc. [London]*, 94 (1908), Nos. 552, II, p. 880; 533, II, p. 975; *Jour. Soc. Chem. Indus.*, 27 (1908), No. 23, p. 1167).—This article discusses the morphology and biology of *Bacillus radiobacter* in the light of recent investigations, and reports investigations on the isolation of this organism and to test the behavior of *Azotobacter* and *Radiobacter* in mixed and pure cultures; the rate of nitrogen fixation of mixed and pure cultures of the 2 organisms; the influence of different kinds of carbohydrates on nitrogen fixation; the behavior of the organisms in the presence of sodium nitrate; the consumption of carbohydrates in the assimilation of free nitrogen by *Azotobacter chroococcum*; the intensity of respiration of *A. chroococcum*; chemical processes involved in the breaking down of glucose and mannite by the respiration enzyme of *Azotobacter*; the metabolism balance of *A. chroococcum*, Beijerinck; production of hydrogen in the metabolic processes of *A. chroococcum*, B.; behavior of phosphorus of various phosphatic nutrients in the *Azotobacter* mass; nuclein in the bacterial mass of *A. chroococcum* and in the organism itself; and chemical analysis of the bacterial mass of *A. chroococcum* B.

It is shown that these organisms are widely distributed in nature and are especially abundant in soils having vigorous growth of blue green algae. They do not occur, however, in high lying soils of the Alps. *Radiobacter* has only a slight power of fixing nitrogen as compared with *Azotobacter*, and the fixing

power of the latter is but slightly increased by symbiosis with *Radiobacter*. Of the sugars tested as sources of carbonaceous food of the organisms, l-arabinose gave the best results, and rhamnose the poorest. With dextrose 99 to 224 gm. of sugar was converted into carbon dioxide for every gram of nitrogen fixed. The results obtained with the various sugars suggest that the furfuroids of the soil are the best source of food for *Azotobacter*. Nitrate of soda inhibited nitrogen fixation, but apparently was not as good a food as free nitrogen. It was found that nitrite and ammonia were invariably formed when nitrate of soda was used in the culture medium. *Radiobacter* was shown to be a powerful denitrifier, liberating free nitrogen from nitrate and exhibiting intense respiration.

Analysis of the bacterial mass produced in the cultures showed ash 8.6 per cent, phosphoric acid 4.9 per cent, potash 2.4 per cent, and nitrogen 11.3 per cent.

**Nitrogen and nitragin**, A. J. EWART (*Jour. Dept. Agr. Victoria*, 7 (1909), No. 1, pp. 36-39).—This article discusses briefly the nature and use of commercial cultures of organisms which assimilate free nitrogen, and explains the conditions under which such cultures are likely to be beneficial. The general conclusion is that in the present state of knowledge of the subject the use of these cultures is not to be recommended except under "very special conditions." "The net result of the activity of soil bacteria in rich, well-manured soils is to produce a loss rather than a gain of nitrogen, and hence no advantage is to be expected by the addition of cultures of any kind of bacterium to such soils."

**The inoculation of leguminous crops**, F. J. CHITTENDEN (*Jour. Roy. Hort. Soc. [London]*, 34 (1908), No. 2, pp. 231-254, pl. 1, fig. 1; 34 (1909), No. 3, pp. 491-499).—In experiments at Wisley Garden in 1908 with peas treated with the inoculating material prepared by Professor Bottomley of Kings College, it was found in one series of experiments that "7 out of the 12 plats on which inoculated seed was sown gave smaller crops than the corresponding uninoculated plats, and one gave an equal crop. . . . The crop from the inoculated seed was not better in any way than that from the uninoculated, nor did it reach maturity earlier." In a second series of experiments "only 7 out of 24 rows of inoculated seed gave a greater yield than the uninoculated, one gave an equal yield, and 16 gave a smaller."

Watering peas with the inoculating material gave like results.

The general conclusion drawn is that the inoculation of leguminous crops with the material used is not likely to prove beneficial in ordinary garden soils.

**Experiments on the value of nitro-bacterine**, C. T. GIMINGHAM (*Gard. Chron.*, 3. ser., 45 (1909), No. 1152, pp. 59, 60).—Experiments with peas on very poor and on well manured garden soil at the Southeastern Agricultural College, Wye, are reported. "There was no evidence of any kind to show that the slightest benefit had been obtained by the use of 'nitro-bacterine' on either type of soil."

**Experiments on the value of nitro-bacterine**, F. KEEBLE (*Gard. Chron.*, 3. ser., 45 (1909), Nos. 1150, pp. 20, 21; 1151, pp. 35, 36).—The results obtained by Chittenden (noted above) are discussed, and experiments of a similar character made on the grounds of the botanical laboratory of University College, Reading, are reported.

It was found in these experiments that the increase of yield from inoculated seed was so small that it did not represent a sufficient increase of profit to make the use of nitro-bacterine on ordinary garden soils of practical value. To this extent the results confirm those reported by Chittenden, but they do not confirm the conclusion that inoculation generally decreases the yield.

Experiments on the value of nitro-bacterine, F. J. CHITTENDEN (*Gard. Chron.*, 3. ser., 45 (1909), No. 1153, pp. 68, 69).—Attention is called to certain errors which occurred in a previous report tending to exaggerate the reduction in yield from inoculated seed.

Nitro-bacterine, G. HENSLOW (*Gard. Chron.*, 3. ser., 45 (1909), No. 1154, p. 92).—Beneficial results from watering scarlet runner beans with culture solutions of the "nitro-bacterine" are reported.

Experiments with nitro-bacterine, W. B. BOTTOMLEY (*Gard. Chron.*, 3. ser., 45 (1909), Nos. 1154, pp. 91, 92; 1156 p. 114).—Referring to experiments at Wisley, Wye, and Reading, noted above, the author calls attention to conditions of soil and fertilizing in those experiments which in his judgment account for the unfavorable results obtained.

Investigations on lime nitrogen and nitrogen lime, A. SABASCHNIKOFF (*Mitt. Landw. Inst. Leipzig*, 1908, No. 9, pp. 77-123; *abs. in Chem. Ztg.*, 33 (1909), No. 43-44, *Repert.*, p. 202).—Previous investigations on this subject are reviewed and laboratory investigations on decomposition in soil and fertilizer experiments in the field are reported, as well as investigations on the character and work of the bacteria which cause decomposition of lime nitrogen. Among the more important results obtained were the following:

It was again shown that a culture medium consisting of soil extract, 0.5 per cent of acid potassium phosphate, 0.1 per cent of asparagin, and 0.1 per cent of grape sugar furnishes a very good medium for decomposition experiments with lime nitrogen and nitrogen lime. Formation of ammonia occurs in media which do not contain asparagin and grape sugar, but the formation in this case is very slow. Heating the lime nitrogen solution produced no injurious effect, but to a certain extent promoted the formation of ammonia. Neither on heating nor on standing was dicyandiamid formed in lime nitrogen solutions. The substance produced by heating is very easily decomposed. It is apparently an isomer of dicyandiamid.

Carbon dioxid does not cause the formation of dicyandiamid. It does not retard, but to some extent promotes the cleavage of cyanamid. Calcium cyanamid solutions which had not been heated were decomposed by pure cultures of bacteria only when absorbent substances were present. This fact is of great importance with respect to the action of lime nitrogen and nitrogen lime on soils of low absorptive capacity, and the mixing of these substances with compost appears to be advisable in such cases.

The intensity of the cleavage of cyanamid varied widely in the same soil in the course of the year, depending more upon the time of the year than upon the weather. The nitrogen of lime nitrogen and nitrogen lime was converted in like amount into ammonia and its decomposition was brought about by the same bacteria. Among the very active organisms in the cleavage of cyanamid was *Bacterium erythrogenes*, which also is active in the cleavage of urea.

The chemical changes in lime nitrogen when used as a fertilizer, H. KAPPEN (*Centbl. Bakt. [etc.]*, 2. Abt., 22 (1908), No. 7-10, pp. 281-298; *abs. in Chem. Zentbl.*, 1909, I, No. 4, pp. 310, 311).—This is a further contribution to a controversy with Löhnis on this subject (*E. S. R.*, 20, p. 123).

The decomposition of lime nitrogen, III. F. LÖHNIS and R. MOLL (*Centbl. Bakt. [etc.]*, 22 (1908), No. 7-10, pp. 254-281; *abs. in Chem. Zentbl.*, 1909, I, No. 4, p. 310).—This article reviews previous observations and hypotheses relating to the decomposition of lime nitrogen, referring more particularly to the work of Kappen (*E. S. R.*, 18, p. 1028) and reports further studies by the authors on the hydration of cyanamid, the influence of the soil on the decomposi-

tion of lime nitrogen, the formation and decomposition of dicyandiamid, and the relation of bacteria to the decomposition of lime nitrogen.

The authors conclude from their investigations that the decomposition of lime nitrogen in the soil takes place in the following way: By solution the calcium cyanamid is converted into calcium dicyandiamid  $(\text{CN.NH})_2\text{Ca}$ . On standing of the solution, or more quickly under the influence of heat or the absorptive power of the soil particles, the lime of the cyanamid is set free. The cyanamid under the action of weak acids (carbon dioxid) or heating in the presence of basic substances (caustic lime) is converted into ammonium cyanate and finally into urea, the latter being converted into ammonium carbonate by the action of bacteria.

As Ulpiani found, there is no direct bacterial action on cyanamid. Bacteria do not attack dicyandiamid either in dilute or concentrated solution. In experiments on the decomposition of lime nitrogen in which soil is used it makes no difference whether the solution is heated or not.

Is dicyandiamid a poison for field crops? O. LOEW (*Chem. Ztg.*, 33 (1909), No. 3, pp. 21, 22; *abs. in Jour. Chem. Soc. [London]*, 96 (1909), No. 556, II, p. 177; *Chem. Zentbl.* 1909, I, No. 9, p. 785; *Chem. Abs.*, 3 (1909), No. 10, p. 1197).—Pot experiments with barley on humus garden soil, comparing dicyandiamid (0.75 gm. to 3.5 kg. of soil) on sterilized and unsterilized soil, ammonium sulphate, and no nitrogenous fertilizer, are reported.

The results showed that on sterilized soil dicyandiamid gave the same yield as ammonium sulphate. On unsterilized soil the growth of the plants was seriously interfered with as a result, in the author's opinion, of the formation of injurious compounds from the dicyandiamid through the action of the bacteria. It was noticed in the case both of sterilized and unsterilized soil that the use of dicyandiamid resulted in a drying up of the tips of the leaves of the barley, a result attributed to the excessive accumulation of the dicyandiamid in that part of the plant.

The structural formula of the dicyandiamid is discussed.

An observation on calcium cyanamid, J. AEBY (*Chem. Ztg.*, 33 (1909), No. 17, p. 145; *abs. in Ztschr. Angew. Chem.*, 22 (1909), No. 15, p. 687).—It is reported that a loss of 1.1 per cent due to the formation of acetylene was observed in a lot of calcium cyanamid left exposed to damp air on the wharves at Antwerp. This is attributed to excess of calcium carbide in the material resulting from imperfect methods of manufacture, and it is suggested that a guaranty of the content of this substance should be required in case of calcium cyanamid intended for extended transportation.

The assimilation of potash by plants, W. KRÜGER (*Ztschr. Ver. Deut. Zuckerindus.*, 1908, No. 631, II, pp. 739-750; *Jahrb. Deut. Landw. Gesell.*, 23 (1908), No. 4, pp. 633-649; *abs. in Chem. Abs.*, 3 (1909), No. 3, p. 350).—Fertilizer experiments with sugar beets, rye grass, chicory, barley, rye, peas, potatoes, and other plants are reported, and the factors influencing the assimilation of potash are discussed. These are variety of plant, character and quality of soil, fertilizer, weather, etc., and the micro-organisms of the soil. Attention is called to the importance of the return of fertilizing constituents from the plant to the soil during the period of growth. The effect of good fertilization in offsetting injury from nematodes is emphasized. Lack of potash in the culture of sugar beets was not shown until the reserve of potash in the root had been consumed, when further development was checked.

Phonolith, so-called potash silicate, as a fertilizer, P. WAGNER (*Mitt. Deut. Landw. Gesell.*, 24 (1909), No. 2, pp. 19, 20).—Comparative tests of this material and of sulphate of potash on grass and tomatoes on sandy soils are reported, the results showing that the rock meal furnished so little assimilable

potash that the potash-hunger of the plants was not satisfied. Apparently the potash of this material was very resistant to the solvent action of acids, soils, and plant roots.

On the fertilizing value of the phosphoric acid of vivianite, O. BÖTTCHER (*Deut. Landw. Presse*, 36 (1909), No. 7, p. 61; *abs. in Chem. Ztg.*, 33 (1909), No. 25, *Repert.*, p. 118).—An impure vivianite derived from swamp deposits containing 15.02 per cent of phosphoric acid and 18.1 per cent of water was compared with superphosphate in pot experiments with oats. Taking the efficiency of superphosphate as 100, that of the vivianite was 22 to 30. The phosphoric acid is slowly available and the material has some fertilizing value, but not sufficient to pay for long transportation or much handling.

The phosphorites of Gafsa, Tebessa, and Cape Leuca, R. ROSSI (*Ann. R. Scuola Sup. Agr. Portici*, 2. ser., 7 (1907), pp. 16).—The physical characteristics of phosphorite from these places are given, as well as a description of the preparation of the samples, processes of analysis, and tables showing the results of the analyses.

The average percentages of calcium phosphate shown by the analyses were: Gafsa phosphorite 56.48, Tebessa phosphorite 43.53, and Cape Leuca phosphorite 17.31. The percentages of calcium carbonate in the phosphates were high, being 15.56 in case of Gafsa phosphorite, 36.39 in Tebessa phosphorite, and 70.73 in Cape Leuca phosphorite.

Namban Creek phosphatic deposits, E. A. MANN ET AL. (*Jour. Dept. Agr. West. Aust.*, 17 (1908), Nos. 5, pp. 805-810; 6, pp. 980-982).—Deposits of phosphatic guano occurring in caves in this district are described and analyses are reported showing phosphate of lime varying from 26.6 to 45.25 per cent, and nitrogen from 0.2 to 1.65 per cent. The larger proportion of the phosphoric acid was found to be soluble in citrate solution.

Phosphatic and gypsum deposits, A. DESPEISSIS (*Jour. Dept. Agr. West. Aust.*, 17 (1908), No. 6, pp. 906, 907).—Statistics of the consumption of fertilizers in Western Australia are given, with notes on deposits of phosphate and gypsum which have been discovered in that colony. It is stated that 16,486 tons of fertilizers were imported into Western Australia during the half year ended June 30, 1908. The occurrence of extensive deposits of both phosphate and gypsum is reported.

The present status of the nitrate industry of Chile, GERLACH (*Ztschr. Agrarpolitik*, 7 (1909), No. 1, pp. 10-18).—This article discusses the present and probable future supply of nitrate and the present business problems and organization of the industry.

The Chilean nitrate fields (*Mark Lane Express*, 100 (1909), No. 4036, p. 119).—Reference is here made to the report of the Chilean government inspector of nitrate, which states that the minimum stock in sight is 220,000,000 tons and that there is no danger of a failure of supply for a century at least.

Analyses of fertilizers, R. E. ROSE (*Fla. Quart. Bul. Dept. Agr.*, 19 (1909), No. 1, pp. 1-6, 12-27, 31-35, 46-80, 133-161).—The results of inspection of fertilizers during the year 1908 are reported, with the laws providing for this work and the rules and regulations adopted under the laws, and suggestions regarding the purchase and use of fertilizers. It is stated that inspection tags covering 133,224 tons of commercial fertilizers were sold during the year. This represents an increase of 8,618 tons.

Comparing the economy of high-grade and low-grade fertilizers, it is stated that "the high-grade fertilizers, for but little more than a third advance in price over the cost of the low class goods, furnish two thirds more plant food and five-sixths more commercial value." Those who require low-grade goods

are advised to purchase the necessary materials and have them mixed and bagged at the factory.

Commercial fertilizers, T. L. CALVERT (*Off. Rpt. Sec. Ohio Bd. Agr. on Com. Ferts.*, 1908, pp. 86).—This is a report in the usual form on inspection of fertilizers licensed and analyzed in Ohio during the year 1908. The report also contains notes on trade values of fertilizer ingredients during the year and the text of the new fertilizer law which went into effect November 1, 1908.

## AGRICULTURAL BOTANY.

Linnaeus's lectures on the cultivation of plants, M. B. SWEDERTS (*Uppsala Univ. Aarsskr.* 1907, *Linnéfest Skr.* 1, pp. VIII+107).—This is a translation into German of a series of lectures on the cultivation of plants that are supposed to have been delivered by Linnaeus at the University of Upsala about 1759. The manuscript was found in St. Petersburg a few years ago.

The weeds and suspected poisonous plants of Queensland, F. M. BAILEY (*Brisbane*, 1906, pp. 245, figs. 408).—Brief botanical descriptions are given of the orders, genera, and species of weeds and suspected poisonous plants of Queensland. In each instance the locality is named from whence the specimens were obtained and notes are given regarding their economic, noxious, medicinal, and other properties. With a few exceptions, a portion of each plant is illustrated.

Triple hybrids, H. DE VRIES (*Bot. Gaz.*, 47 (1909), No. 1, pp. 1-8).—An account is given of studies of evening primrose hybrids in which the possibilities of so combining the species as to form triple and even quadruple hybrids are described. The author states that twin hybrids are produced when the pollen of *Enothera lamarckiana* or of one of its derivatives is crossed with the European subspecies of *Æ. biennis* or of *Æ. muricata*. Triple hybrids may be produced by combining one of these with species such as *Æ. lata* and *Æ. scintillans*. The segregation of characters in the progeny is discussed.

The chemistry of plants, G. ANDRÉ (*Chimie Végétale*. Paris, 1909, pp. XII+560, figs. 14).—This is issued as a portion of *Encyclopédie Agricole*, published under the direction of G. Wery. While essentially an elementary work, the author designed this treatise for those who want to gain something more than a superficial knowledge of the processes of plant nutrition.

Chapters are given on the essential elements, structures, and function of vegetable material in general, after which the function of chlorophyll, formation of intermediate ternary compounds, assimilation and elaboration of nitrogen, chlorophyll and other plant pigments, germination, respiration, mineral composition, the forms under which various mineral substances are found in plants, and the rôle of water in the plant kingdom are discussed.

While the treatment is popular in its nature, the author has incorporated the results of many recent investigations and states the more recent theories on plant life and processes.

The bio-chemistry of animals and plants, O. ROSENHEIM (*Sci. Prog. Twentieth Cent.*, 2 (1908), No. 8, pp. 676-699; 3 (1908), No. 9, pp. 106-123).—This is a summary giving the present status of the bio-chemistry of plants and animals, the first part of the paper being devoted to a discussion of the nitrogen cycle, including nitrification, denitrification, and nitrogen fixation, the synthesis of proteids, and the history, occurrence, properties, classification, etc., of proteids. In the second portion of the paper the significance of proteids in the plant is discussed, and the occurrence and function of a number of other compounds, such as phytotoxins, toxolecithides, lipoids, inosite, organic phosphoric

acids, etc., are described. The author concludes with a discussion of chlorophyll and its relation to hemoglobin.

Some problems and results of a study of the mechanics of plant anatomy, E. KÜSTER (*Prog. Bot.*, 2 (1908), No. 4, pp. 455-558, figs. 24).—The author discusses some of the problems of cell and tissue development in plants, the paper being based upon lectures given at the University of Halle in 1907. The literature of the subject is quite extensively reviewed.

The effects of variations in the inorganic salts and the reactivity of the external medium upon the nutrition, growth, and cell division in plants and animals, B. MOORE, H. E. ROAF, and R. E. KNOWLES (*Bio-Chem. Jour.*, 3 (1908), No. 6-8, pp. 279-312, pls. 4).—The results of experiments with acid and alkaline salts on the growth, cell division, etc., of various plants, and their effects on certain animals are described. The inorganic salts used were sodium hydrate, hydrochloric acid, potassium hydrate, sodium carbonate and bicarbonate, monosodium phosphate, and disodium phosphate. The plants experimented with were hyacinths and onions, the various solutions being made up on the basis of gram-molecular strengths.

Marked effects were produced upon the dividing cells of plant rootlets by small variations in the alkalinity or acidity of the medium. The range of ionic concentrations compatible with plant growth was a very narrow one. Short of the lethal dose there was found a marked stimulation by the alkali which was not found with the acid. The kation present appeared to have a specific effect, and potassium was more stimulating than sodium to both rootlets and foliage leaves. The phosphatic anion had a special effect upon the flower, causing an increase in size at optimum strength. At higher concentrations, irregular inflorescences with packed florets on dwarfed stalks were obtained.

The cytological effects of the different inorganic salts were studied, and there was found to be an absence or depression of nuclear division with the acid, and a thickening of cell walls. With the alkalis there was an increase in nuclear division, changes in chromosomes, and the cell outlines became obscured.

Both acid and alkaline phosphates at optimum concentrations caused increased growth in amphibia. In the case of the alkaline salts, higher concentrations resulted in death, preceded by a stage of hyper-excitability.

The effect on mammals showed that either alkaline or acid phosphates in the proportion of 0.26 to 0.38 gm. per kilogram of body weight caused an increased metabolism with diminishing body weight, and finally death.

The distribution of the indispensable inorganic nutrients in bean seedlings, II, L. VON PORTHEIM and M. SAMEC (*Flora*, 99 (1909), No. 3, pp. 260-276).—In a previous publication (*E. S. R.*, 19, p. 426), the distribution of the more essential inorganic substances in bean seedlings when grown in Knop's solution with and without lime was shown. In the present paper an account is given of the distribution of these same compounds in bean seedlings with reference to the calcium and magnesium ratios. Analyses are reported showing the dry weight; ash; percentage of lime, magnesia, potash, phosphoric acid, sulphuric acid, chlorin, and iron oxid in the ash; and the weight of lime, magnesia, potash, and phosphoric acid in the ash of 250 of the seedlings. The data are grouped to show the amount of these different compounds in seedlings grown in distilled water and in normal solutions of the nitrates of lime and magnesia and various mixtures of these compounds.

The plants became diseased when grown in distilled water and in the solutions containing magnesium nitrate, the roots being stunted, browned, and often rotten. A mixture of the two compounds in the nutrient solution resulted in an increase in the amount of magnesia taken up and a reduction in the proportion

of lime. The slight increase in the magnesia content in the plants grown in the solutions containing lime and magnesia is believed to be due to the protective or neutralizing action of the lime.

The phosphorus nutrition of plants, CAVALIER and ARTUS (*Trac. Sci. Univ. Rennes*, 6 (1907), No. 1, pp. 132-139).—A study was made of the availability of different sources of phosphorus for the nutrition of maize grown in sand and watered with nutrient solutions that varied only in the phosphorus compound employed.

In the cultures, which were maintained for 92 days, the same amount of phosphorus was added to each, the calculated quantity being 2.14 gm. The various sources of phosphorus were sodium orthophosphate, pyrophosphate, metaphosphate, and phosphite as inorganic compounds, and potassium monoethylphosphate, sodium diethylphosphate, triethylphosphate, and monoallylphosphate, and calcium glycerophosphate as organic compounds. The latter is said to be a commercial preparation, while for the others the author made and purified his own compounds. At the end of the experiment, the total weight, ash, phosphorus content, etc., for the different plants were determined.

All the treated plants were better developed than the checks, except in the lot where the glycerophosphate was used. This substance, or impurities which it contained, proved injurious to all the plants, greatly reducing their development. There was little or no difference in the proportion of phosphorus in the dry matter of the different lots of plants, but where an actual increase in phosphorus was noted, it was accompanied by an increased growth of the plants, hence by greater dry weight.

The experiments show that plants are not necessarily restricted to the orthophosphoric acid salts for their phosphorus supplies, but that maize is capable of taking phosphorus from a number of other organic and inorganic compounds.

Phosphorus and the formation of amino acids by the higher plants, F. SCURTI (*Gaz. Chim. Ital.*, 38 (1908), II, No. 2, pp. 272-275).—According to the author, a correlation exists between the presence of phosphorus and the formation of proteids in the higher plants. This correlation is not limited to the proteid nitrogenous bodies, but also pertains to the amino acid group of compounds, and probably plays an important rôle in the synthesis of all albuminoid substances in plants.

The decomposition of sugar during the processes of respiration, P. B. JENSEN (*Ber. Deut. Bot. Gesell.*, 26a (1908), No. 9, pp. 666, 667).—The author states that the decomposition of sugar during alcoholic fermentation is not a single process but involves two stages. The intermediary product is said to be dioxycetone. In the process of decomposition the dextrose is broken down into dioxycetone, which may further change into carbon dioxid and alcohol, or, by the addition of oxygen through the action of oxydase, into carbon dioxid and water.

On the "strength" and development of the grain of wheat, W. E. BRENCHELY (*Ann. Bot. [London]*, 23 (1909), No. 89, pp. 117-139, pls. 2, figs. 5).—This investigation was inaugurated with a view to determining the question of the "strength" of wheat from a biological standpoint. The term "strength," according to the author, is by no means exactly defined, but for the purpose of his investigation it is taken to indicate the capacity of wheat to produce a large, well-piled loaf of bread.

In the author's summary it is stated that no cytological differences can be observed between wheat grains of different varieties, grown under similar conditions, which produce flour of varying strengths, nor are there any differences indicative of strength to be found in the developing grains of one variety of wheat grown in the same field, under similar soil and climatic conditions, but

subject to radical differences in manuring. The reputed difference in strength between grains of the same variety grown under identical conditions, but cut green and dead ripe, is not associated with any significant cytological change.

Examination of the different grades of flour obtained during the various processes of roller milling shows that the cells of the aleurone layer very rarely get into the flour, but remain attached to the bran. The endosperm of the seed during its development arises in the first place by free cell formation, but after about a week wall formation begins, starting from the periphery of the embryo sac and proceeding inward. The peripheral layer is marked off about two weeks after pollination, and develops into the aleurone layer. The deposition of starch grains begins in the middle of the flanks of the endosperm at the lower end of the grain and proceeds upward and outward. Reserve nitrogenous materials enter at the same time as the starch. During the process of ripening a disorganization of the endosperm nuclei takes place, caused by the increasing pressure of the surrounding food stuffs. The nuclei lose their nucleoli, become deformed, and finally appear as a fine network spread out between the intruding starch grains.

A study of the development of the embryo was made, and it was found to be normal, but a fifth lateral rootlet is said to be formed in addition to the two pairs of laterals usually described.

The presence of amylase in old seeds, BROCC-ROUSSEU and E. GAIN (*Compt. Rend. Acad. Sci. [Paris]*, 148 (1909), No. 6, pp. 359-361).—In previous accounts (E. S. R., 20, p. 130), the authors have shown that the duration of diastases in seeds is limited. In the present report the results are given of a study of wheat taken from museum specimens that are known to be 50 years old.

In this investigation dextrinase and amylase were found present and still capable of transforming starch into sugar. The experiments did not permit of definite conclusions as to whether the diastatic action was retained with its initial power for the entire period. They confirmed the conclusion, however, that the power of germination in seeds is not entirely due to the action of certain diastases, as the seeds in no case would germinate although the diastase was present.

The presence of oxydases in india rubber, D. SPENCE (*Bio-Chem. Jour.*, 3 (1908), Nos. 4, pp. 165-181; 6-8, pp. 351, 352).—A study has been made of the latex of Para rubber trees and also of fresh latex from *Funtumia elastica*, from which the author is able to show the presence of oxydases in the latex. He believes that the darkening in color of raw rubber is due to an oxydase which is associated with the protein or the so-called insoluble constituent of the rubber. Further experiments are to be carried on to determine how far the oxydase is responsible for certain other changes occurring in raw rubber, such as decomposition, oxidation, and the like.

The second paper reports an examination of 4 separate samples of latex from *Hevea brasiliensis*, Para rubber, in each of which was found evidence of the presence of an oxidizing enzym, the chemical properties of which have not yet been studied.

The author suggests that the caoutchouc is probably a reserve food material for the plant, and that to account for its formation and subsequent decomposition the presence of oxidizing enzymes must be considered.

Relation of plant growth and vegetation forms to climatic conditions, J. J. THORNER (*Plant World*, 12 (1909), No. 1, pp. 1-7). An account is given of studies on the relation of plant growth to climatic conditions in different parts of Arizona, particular attention being given to winter and summer annals. The author claims that on account of temperature conditions, it is impossi-

ble to grow successfully during the winter months the annual summer flowering plants which do not survive the intense heat of the summer, or to grow during the summer months the annual flowering plants generally referred to as winter-growing species. This also holds true for vegetables.

**Plant culture in diffused daylight**, A. BURGERSTEIN (*Verhandl. K. K. Zool. Bot. Gesell. Wien*, 58 (1908), No. 6-7, pp. 322-329).—Experiments are reported on the growth of about 20 species of ornamental plants in diffused light and in beds so situated as to receive direct sunlight for a few hours in the morning and evening and diffused light during midday.

Almost without exception the growth of the stalks, leaves, flowers, and seed capsules was greatest in what is termed the mixed light. The plants remained green for a longer period, and flowered more abundantly. The dry weight of the plants which received the early and late sunlight was from 1.4 to 11.2 times as great as that of similar species grown in diffused light. Similar conditions were noted for flower and seed production.

**The influence of light on the development of fruits and seeds**, W. LUBIMENKO (*Compt. Rend. Acad. Sci. [Paris]*, 147 (1908), No. 24, pp. 1326-1328).—Studies by the author have shown that while a certain amount of illumination is absolutely essential during the early stages for the formation of fruit, after a fruit has passed a short stage of development it is possible to complete its development in greatly reduced light. If self-pollinated plants are inclosed before the pollination of their flowers in black or white bags fastened to the plants, in general but very few normal fruits will be formed, due to the insufficient illumination. In one instance 30 heads of wheat were inclosed in black sacks before the pollination of the flowers and only 3 to 5 grains were produced to the head, while heads in the same stage of growth inclosed in white bags gave from 16 to 25 grains per head. Similar results were obtained with peas.

Studies made with a considerable number of plants show that there is an optimum for the illumination required for the development of dry matter in fruits and that this optimum corresponds to a somewhat attenuated illumination. The maximum dry weight of seeds and pericarp of a number of fruits, such as currants, cherries, apples, pears, etc., corresponds to illumination slightly less than the maximum of light. It is shown also that the acidity of the fruit diminishes with the illumination. In the majority of cases fruit inclosed in sacks was less acid than that maturing in the open. On the contrary, the material reduced by Fehling's solution was greater in those fruits which were inclosed in sacks and less in those ripening normally.

**The influence of radium rays on a few life processes of plants**, C. S. GAGER (*Pop. Sci. Mo.*, 74 (1909), No. 3, pp. 222-232, figs. 13).—This paper is a nontechnical account of some of the more striking results described in the author's memoir on the effects of the rays of radium on plants (*E. S. R.*, 20, p. 929).

The author summarizes his investigations, stating that radium acts as a stimulus to the various physiological processes of plants. If the strength of the radium, the duration of exposure, and other conditions are suitable, the response is an excitation of function, but if the radium is too strong and the exposure too prolonged, the result is a retardation, or a complete inhibition of function, or even the death of the plant. There were found to be differences in sensitiveness between individuals, and also between different species and different tissues.

**Electroculture**, J. B. MARTIN (*Prog. Agr. et Vit. (Ed. l'Est-Centre)*, 29 (1908), No. 41, pp. 439-442).—An account is given of some experiments carried on by Lieutenant Basty for the past 7 years in the vicinity of Tours.

France, to determine the effect of electricity applied before germination and during the various stages of development of plants on the earliness, abundance, and quality of fruit. The plants experimented with were potatoes, sainfoin, white mustard, spinach, beets, hemp, flax, barley, and wheat.

The experiments show that there is an evident stimulating action of atmospheric, dynamic, and static electricity on the growth of plants, practically all of the plants being more vigorous, blooming earlier, and giving a larger yield of leaf, stem, tuber, or other part compared.

Comparisons of the beginning of development of perennial and annual plants, G. ANDRÉ (*Compt. Rend. Acad. Sci. [Paris]*, 147 (1908), No. 26, pp. 1485-1487).—A study was made of the walnut and horse-chestnut in the first year or two of growth and comparisons made with the dry material in annual plants.

In the annual plant the dry material in the young root is relatively high, representing about one-tenth of the total weight of the plant. This weight diminishes toward the end of the period of growth, when it does not represent more than 3 to 5 per cent of the total dry weight of the plant. In the case of the perennial plants the weight of the root is relatively low and is much less than with similar annual plants.

A study of the distribution of the mineral matter at different periods of growth showed that in annual plants it amounted to about one-seventh of the weight of the plant at the beginning of vegetative growth, and by the time of flowering to about one-fifteenth. With the walnuts and horse-chestnuts the proportionate weights were from about one-fiftieth to one-thirtieth.

Studies were also made of the distribution of phosphoric acid in the roots. The content was found to be relatively high at all periods of growth, but the proportionate amount was somewhat less in the walnut than in the horse-chestnut. The phosphoric acid continues to be taken up from the soil through the roots and supplied to the stem up to the end of active growth, when part of it is returned from the leaves before their fall. This translocation occurs in annual plants at the end of their period of growth.

Perennial plants during the first and second years of their growth behave very similarly to annual plants up to the time of their flowering. The absolute weight, however, of the roots of perennial plants is considerably greater than that of the annuals, and the reserve mineral materials are greater, particularly in the roots, where phosphoric acid among the mineral elements is stored for use in later stages of growth.

The perennation of the clover dodder (*Cuscuta epithymum*), F. C. STEWART and G. T. FRENCH (*Torrey*, 9 (1909), No. 2, pp. 29, 30).—Most botanical writers are stated to have considered the species of *Cuscuta* as annuals, although as long ago as 1868 Kühn claimed that clover dodder lived over winter on clover and alfalfa plants in Germany. This statement has been questioned by a number of investigators and confirmed by others, but apparently until quite recently there was no published record of any dodder living over winter in the United States.

The authors' investigations during the past 3 years have indicated that clover dodder lives over winter in New York alfalfa fields, hibernating on the crowns of alfalfa, red clover, and certain weeds, among them the fleabane (*Erigeron annuus*) and yellow trefoil (*Medicago lupulina*). It has also been found passing the winter on dandelion. The fleabane and the yellow trefoil are generally classed as annuals, but they are regularly biennial in New York.

Experiments have shown that it is quite possible, by placing the dodder-infested crowns of plants in a moist chamber for a few days, to secure an abundant growth, indicating that the plant passes the winter in a viable state. It appears probable that this is the principal method by which it is propagated

On the parasitism of *Siphonostegia*, S. KUSANO (*Bul. Col. Agr. Tokyo Imp. Univ.*, 8 (1908), No. 1, pp. 51-57, figs. 5).—The author has been carrying on studies on Japanese phanerogamic parasites, and in this paper gives an account of *S. chinensis*, which appears to be a hemiparasite. It is a herbaceous plant common in grassy fields of Japan. A detailed account is given of its anatomical structure.

Studies on *Æginetia indica*, S. KUSANO (*Bul. Col. Agr. Tokyo Imp. Univ.*, 8 (1908), No. 1, pp. 59-78, pl. 1).—This paper gives an account of some of the facts in the life history of *Æ. indica*, a phanerogamic parasite common in Japan, where it occurs on certain species of monocotyledonous plants. Experiments have shown that the seed of the parasite will not germinate unless it has the stimulus of the roots of other plants. The stimulation may be induced by the presence of the roots of a great many plants, but its parasitism is limited to certain species of Cyperaceæ, grasses, ginger, cannas, etc.

### FIELD CROPS.

Report on the agricultural and botanical departments, Barbados, D. MORRIS (*Imp. Dept. Agr. West Indies, Rpt. Agr. and Bot. Depts. Barbados, 1898-1907*, pp. 37, figs. 14, dgms. 2).—This report covers the period 1898-1907, and includes a review of the sugar-cane experiments since 1884. The work with cotton, bananas, and other crops is also noted.

Since 1898, when the Imperial Department of Agriculture was established, about 30,000 canes have been raised from seed. In 1904 work was begun which resulted in securing 5 hybrid sugar canes through artificial cross-pollination. The raising of seedling canes resistant to disease and yielding a large amount of sugar is also one of the principal lines of work. The history of these experiments is given in full and the results secured each season are briefly summarized. During recent years a number of canes are being tested which seem to give even better results than B. 147 and B. 208, which have given very satisfactory yields. Among these canes are B. 1753, B. 3390, B. 3412, B. 3675, B. 3696, B. 3747, B. 6204, and B. 6450.

The results of fertilizer experiments with sugar cane are summarized for the past 13 years. In the nitrogen series the most satisfactory yields were obtained where 60 lbs. of nitrogen as sulphate of ammonia was applied in June, in addition to 80 lbs. of assimilable phosphates, and 60 lbs. of potash as sulphate of potash, the average yield being 7.911 lbs. of saccharose per acre.

In the superphosphate series of experiments the best results were secured on the plat which received only nitrogen and potash. In the basic slag series of plats the best result for 12 years was obtained on the plat which received 100 lbs. of phosphate as basic slag, the yield being 8.446 lbs. of saccharose per acre as compared with 8.406 lbs. on the check plat.

The best result in the potash series was obtained on the plat which received 80 lbs. of potash as sulphate of potash, in addition to 15 lbs. of nitrogen as sulphate of ammonia in January and 45 lbs. in June, and 80 lbs. of phosphate as superphosphate of lime applied in January. The average yield in this series was 7.739 lbs. of saccharose per acre.

Tillage experiments showed a difference of  $2\frac{1}{2}$  tons of canes per acre between the best and the poorest plat. The most favorable results were secured from close subsoiling, digging the cane holes, manuring, and cultivating in the usual manner, and the least favorable results were secured on the plats ridged with a disk plow, turning under farmyard manure 8 in. deep, planting the canes in rows at the bottom of the furrows, and cultivating.

The cotton industry in Barbados is described and the results of fertilizer experiments are reported. In determining the quantity of nitrogen needed to produce the best results it was found that the most satisfactory yields were secured when nitrogen as sulphate of ammonia was applied at the rate of 30 lbs. per acre, the increased yield amounting to 279 lbs. of seed cotton. In the phosphoric acid series 40 lbs. of phosphoric acid as superphosphate of lime produced the best effects, the increase in seed cotton being 281 lbs. per acre. The most satisfactory returns in the potash series were secured where 20 lbs. of potash as sulphate of potash was used. In these tests the increase of seed cotton per acre amounted to 196 lbs.

Nitrogen fertilizer experiments on meadows, BACHMANN (*Landw. Wchnbl. Schles. Holst.*, 59 (1909), No. 2, pp. 22-24).—Cooperative tests are reported in which sulphate of ammonia, nitrate of soda, and nitrogen lime were compared. In one experiment the plats were 0.05 hectare (about  $\frac{1}{8}$  acre) in size and each received 25 kg. each of Thomas slag and kainit. The nitrogen was applied in 10 kg. of sulphate of ammonia and 10 kg. of nitrogen lime, each substance containing 20 per cent of nitrogen.

In 1907 the average yield of hay from one cutting on the plat receiving no fertilizer whatever was 62.5 kg., and on the plat treated only with Thomas slag and kainit 86.5 kg. The plat receiving one-fourth of the sulphate of ammonia in the spring and three-fourths in the fall gave 110.5 kg. of hay, the plat receiving the entire application of sulphate in April 133.5 kg., the one receiving the sulphate in two applications in spring 176 kg., and the plat treated with the nitrogen lime in one application early in April 165 kg. In 1908 the yields of hay on these plats without further fertilization were 125.5, 161, 183.5, 189, 203, and 207.5 kg. respectively.

The results of a second and a third experiment show that nitrate of soda given in two applications in the spring gave the best yields of hay, being followed by sulphate of ammonia and nitrogen lime, each given in a single application in the spring.

Manurial experiments on grass land, 1908, J. PERCIVAL (*Univ. Col. Reading, Dept. Agr. and Hort. Bul. 4*, pp. 27).—The cooperative fertilizer experiments on grass land were conducted at 13 centers. Nitrogen, phosphoric acid, and potash were applied in different combinations, the applications consisting of 1 cwt. of nitrate of soda, 5 cwt. of basic slag, and 3 cwt. of kainit per acre, with the exception that in the complete application only 2 cwt. of kainit was used. Barnyard manure was applied at the rate of 16 loads per acre.

The increase in crop as due apparently to the different fertilizer treatments was as follows: Nitrate of soda alone, 5 cwt.; kainit alone, 5 cwt.; slag alone, 10 cwt.; the complete fertilizer application, 15.25 cwt.; barnyard manure, 13.75 cwt.; slag and kainit together, 10.25 cwt.; slag and nitrate of soda, 12.75 cwt.; and nitrate and kainit together, 11.25 cwt. The herbage grown with the commercial fertilizer was of a much better quality than that produced with barnyard manure.

It was observed that soils containing less than 0.025 to 0.030 per cent of available phosphoric acid generally responded freely to the use of a phosphatic fertilizer such as slag or superphosphate. Soils containing less than 0.010 per cent of available potash gave increased yields and improved quality of grass when kainit or sulphate of potash were used.

Rotation experiment, R. B. GREIG (*Aberdeen and No. of Scot. Col. Agr. Bul. 10*, pp. 11-16).—The rotation consisted of turnips, barley, and hay, and the standard application of fertilizers per acre comprised 20 lbs. of nitrogen, 100 lbs. of phosphoric acid, and 40 lbs. of potash. The results showed that super-

phosphate gave a profit of 20s. per acre, basic slag 17s. 3d., and ground Florida phosphate 5s. 9d., and the use of bone meal a loss of 27s. 3d. per acre. When these fertilizers were applied with barnyard manure they all gave a profit, the largest £4 2s. 7d. per acre over the unmanured plat being secured from ground Florida phosphate.

**The utilization of straw**, A. GRÉGOIRE (*Rev. Écon. Internat.*, 6 (1909), 1, No. 2, pp. 438-448).—The value of straw for litter, manure, and feeding is pointed out, and a résumé of experiments on the effect of straw in barnyard manure and on the preparation of straw for feeding purposes is presented.

**Southern crops**, edited by G. F. HUNNICUTT (*Atlanta, Ga.*, 1908, pp. 245, figs. 10).—This book treats of the culture of cotton, cereals, hay, forage and root crops, and also of several of the most common vegetables.

**Cotton production in Egypt**, F. C. ROUX (*Rev. Écon. Internat.*, 6 (1909) 1, No. 2, pp. 303-339).—This article discusses the history of cotton culture in Egypt, the progress in its cultivation, and the systems of irrigation and drainage in use, and presents statistics on the production and commerce.

**International Cotton Congress, Paris, 1908** (*Off. Rpt. Internat. Cotton Cong.*, 5 (1908), pp. 341).—This is the official report of the Fifth International Cotton Congress held in Paris, June 1-3, 1908. The proceedings have a bearing on the various phases of the cotton industry, including statistics with reference to production and commerce, and papers on cotton growing in the United States, the Congo Free State, the French and German colonies, Asia Minor, and the Eritrean colony of Italy. Copies of the statistics issued by the International Federation of Master Cotton Spinners' and Manufacturers' Associations in regard to the consumption of cotton and stocks of cotton in spinners' hands are given in an appendix.

**Potato variety tests by the German experiment station for potato culture**, C. VON ECKENBRECHER (*Ztschr. Spiritusindus.*, 1909, Sup., pp. 3-56; abs. in *Deut. Landw. Presse*, 36 (1909), Nos. 15, pp. 159, 160; 16, p. 174).—Cooperative tests were conducted in 1908 in 27 different localities of Germany with 20 varieties of potatoes, and the results secured in each individual test are reported in tabular form and described.

According to starch content the leading varieties were Agraria, Erste von Nassenheide, and Prof. Wohltmann, with 21.5, 21.3, and 21 per cent of starch, respectively. The leading varieties in productiveness and their yields were as follows: Hassia, 27,640 kg.; Alma, 25,010 kg.; and Fürstenkrone, 24,910 kg. per hectare. Arranged according to starch production, Prof. Wohltmann stood first with a yield of 5,180 kg., Böhms Erfolg second with 5,060 kg., and Switez third with 4,920 kg. per hectare.

Notes on the composition, disease resistance, keeping quality, and value for different uses of the varieties are given, and all results are tabulated in detail. Bojar, Switez, Brocken, Bohun, Böhms Erfolg, Erste von Nassenheide, and Prof. Wohltmann showed the highest keeping quality, and Alma, Bojar, Böhms Erfolg, Richter Imperator, and Brocken are considered the best varieties for eating purposes.

**Potato variety tests conducted by F. Heine at Hadmersleben, 1908**, W. OETKEN (*Ztschr. Spiritusindus.*, 1909, Sup., pp. 57-66).—In 1908, 129 varieties of potatoes were grown and yielded on an average 28,640 kg. of tubers per hectare (about 25,500 lbs. per acre), containing 17.90 per cent of starch and producing an absolute average yield per hectare of 5,126 kg. (4,562 lbs. per acre).

**The beet-sugar industry**, A. BLUE (*Census and Statis. [Canada] Bul.* 9, pp. 75, figs. 3).—This bulletin describes the present development of the beet-sugar

industry in Canada, outlines its possibilities, and presents statistics with reference to sugar production, consumption, and commerce.

**Tobacco, J. G. SMITH** (*Honolulu Chamber Com. Ann.*, 1908, pp. 123, 124).—The possibilities of tobacco culture in Hawaii are briefly discussed. It is stated that in 1908 about 60 acres were grown. It is estimated that the planting for 1909 will be from 300 to 500 acres and that the output for the next 3 years will be about 5,000 bales.

**Notes on tobacco, J. VAN LEENHOFF** (*Transvaal Dept. Agr., Farmers' Bul.* 2, pp. 9, figs. 7).—General notes on tobacco soils and seed-bed management are presented.

**How to produce bright tobaccos, J. VAN LEENHOFF** (*Transvaal Dept. Agr., Farmers' Bul.* 10, pp. 16, figs. 4, dgm. 1).—General directions for growing this type of tobacco and for curing it are given.

**Report on turnip experiment, 1907, R. B. GREIG** (*Aberdeen and No. of Scot. Col. Agr. Bul.* 10, pp. 1-10).—Nitrate of lime and calcium cyanamid were practically as effective as sulphate of ammonia. The cyanamid was applied with the seed and appeared to have no detrimental effect. Not taking the residual value into account, 5 cwt. of superphosphate was applied at a loss as compared with  $2\frac{1}{2}$  cwt. The results with high-grade and low-grade slag showed but little difference.

**On the inheritance of strength in wheat, R. H. BIFFEN** (*Jour. Agr. Sci.*, 3 (1908), No. 1, pp. 86-101, dgm. 1).—The statement is made in this article that Red Fife after having been grown in England for 6 years is still equal in strength to the same variety grown in Canada. Culture tests have shown that in some localities this variety produces better crops than the common English sorts, while in others its yields are not profitable. It has also been brought out that the straw is not as strong as desirable. These facts have led to attempts to originate varieties having the productivity of common English wheats combined with the strength of the Red Fife.

Varieties with soft starchy grains were crossed with the Red Fife, which produces hard and translucent kernels. Among soft varieties, Rough Chaff and Rivet when grown on poor soil have rarely produced translucent grains, while in Squarehead Master, Browick, Standup, and others opaque and translucent grains have often been found in one and the same head when the varieties were grown on poor soil. In the experiments referred to, Red Fife was used more than any other variety as a strong parent, but a considerable number of varieties of Russian and Canadian wheats were also included.

The F. 1 generation of plants raised from the hybrid grains produced a grain of undoubted strength, but no indications of segregation into strong and weak grains could be detected at this stage. The F. 2 generation was grown under uniform soil conditions and each plant harvested separately. The grain types were sorted out, and in the cases examined the segregation into strong and weak types was perfectly obvious. On attempting, however, to count out the types represented in the F. 2 generation it was found that some crosses gave simple Mendelian ratios, while others could not be sorted with any accuracy. In one cross between Rough Chaff and Fife wheat 4 types of grain were present, strong red, strong white, weak red, and weak white. In the first 100 samples the proportions of these were 58:16::18:8, and in the second, 59:18::16:7, showing a reasonably near approach to the 9:3::3:1 ratio expected when the characters redness and whiteness and strength and weakness are concerned. On the other hand, the F. 2 generation of a cross between Red Lammas and Red Fife contained plants with obviously strong and weak grains, but between the extremes there was a long series of plants which could not be classified with any certainty.

From 30 to 40 plants were raised from individuals of the F. 2 generation, these being selected for the most part for recessive chaff and color characters. The grain characters of parent and progeny were as follows: The F. 2 generation plants of Rough Chaff crossed with Fife, which were used in the test, represented 50 strong and 12 weak plants, and the types of the F. 3 generation showed 16 strong, 34 mixed, and 12 weak plants. In the case of the hybrid between Lammas and Red Fife the F. 2 generation plants sown represented 50 strong, 20 mixed, and 10 weak individuals, while the types of the F. 3 plants showed 50 strong, 3 strong and 17 mixed as corresponding to the 20 mixed in the F. 2 plants, and 10 weak individuals. It is pointed out that in the first case strength is dominant to lack of strength and that the heterozygotes are indistinguishable from the dominant homozygotes, but that in the second case the domination is not so sharply marked and the heterozygous individuals can be distinguished with a certain degree of accuracy. These examples were typical of some 30 others, but in most of them it was not considered necessary to determine whether the recessive lack of strength was pure from the moment of its appearance in the F. 2 generation. Forty of 66 strong cultures proved homozygous in all respects. The grain of the F. 3 generation was planted and the result demonstrated the value of Mendelian methods, for in this F. 4 generation the types appeared perfectly fixed.

The milling of these grains showed that they were strong wheats, and this character was so prominent that the miller without knowing the origin of the grain he was grinding noted that it ground like Manitoban wheat. Later, baking tests also confirmed the conclusion that strength and lack of strength segregate from one another in the F. 2 generation in the same manner as the morphological characters already examined.

In another experiment of this kind, a cross between Polish wheat (*Triticum polonicum*) and Rivet wheat (*T. turgidum*) was studied. The grain of the Polish wheat is brittle, translucent, and white in color, and has an average nitrogen content of 2.2 per cent, while the Rivet wheat is a typical starchy red wheat with a soft, mellow endosperm and an average nitrogen content of about 1.6 per cent. In the F. 1 generation the grain was uniformly brittle, translucent, and red. In the following generation the expected segregation into red and white, translucent and starchy grains occurred; but the mode was not as simple as in certain of the crosses referred to above. When the endosperm characters were taken into consideration it was found that many plants produced grain which could not satisfactorily be placed in either the starchy or the translucent class. The results of a further examination showed that the distribution of the nitrogen content is not affected by the shape of the glumes. It is stated that the failure to give sharp segregation into two or more groups in the F. 2 generation is not uncommon in crosses between cereals. In the F. 3 generation it was shown that all plants selected on the basis of short or long glume character bred true to these characters, and that when they were chosen from the intermediate series they proved heterozygous. The author points out that an analysis of the F. 3 generation is required to unravel the mode of segregation, when it will be found that the heterozygotes can be at once distinguished from the homozygotes and that they occur in the ordinary Mendelian proportions.

The analysis of the F. 2 generation showed that the grains with a translucent endosperm were high, and those with a mellow, starchy endosperm low in nitrogen. Grains flecked with starchy patches generally showed an intermediate nitrogen content, but the percentages varied widely. A slightly flecked sample, for instance, did not always show a higher content than one in which the grains were starchy. The plants producing translucent grain were considered to be

homozygous with regard to high nitrogen content and those with mellow grain were considered to be pure with respect to low nitrogen content. Analyses made of such bulk samples gave an average content of 2.4 and 1.6 per cent of nitrogen, respectively. The remaining samples were mixtures of translucent, starchy, and flecked grains, the last type being the most abundant. The occurrence in one F. 3 bunch of grain resembling each of the parental forms is taken as showing that the F. 2 plant from which it was descended was heterozygous in its endosperm characters. The total nitrogen contents of the majority of such F. 2 plants fell within the limits of 1.7 to 2.1 per cent. Thus, the nitrogen content from 1.3 to 1.6 or from 2.3 to 2.6 marked approximately the pure low or pure high types distinguishable from the heterozygotes by analyses only. The total number of plants with low nitrogen content was 26, 63 were apparently heterozygotes, and 21 were high in nitrogen.

The baking properties of a number of hybrid wheats, as determined by other investigators, are discussed, and the results taken in all are believed to indicate that the problem of breeding strong wheats suitable for English conditions offers no special difficulties. It is also believed that high yielding capacity and strength can be obtained in combination in the same variety, although it still remains to be determined whether high and low yielding capacity segregates at the F. 2 stage.

## HORTICULTURE.

**The scientific aspects of Luther Burbank's work**, D. S. JORDAN and V. L. KELLOGG (*San Francisco, 1909, pp. XIV+115, pls. 14, figs. 20*).—This work comprises a paper entitled Some Experiments of Luther Burbank (E. S. R., 16, p. 773), by D. S. Jordan, and one entitled Scientific Aspects of Luther Burbank's Work, by V. L. Kellogg. These papers were originally published in *Popular Science Monthly*, and are here reprinted in book form with the view of acquainting general readers with the scientific character and value of Burbank's work.

**Vegetable growing in Cuba**, C. F. AUSTIN and E. W. HALSTEAD (*Estac. Cent. Agron. Cuba Bul. 13, pp. 44, pls. 6*).—This bulletin reports the practical results secured by the station during the past 3 years in growing and marketing various kinds of garden vegetables. Brief descriptions are given of the different varieties grown, including statements relative to their adaptability to the soil and climatic conditions of Cuba.

**The home garden**, E. E. REXFORD (*Philadelphia and London, 1909, pp. 198, pls. 8*).—This is a popular work on vegetable and small-fruit growing for the use of the amateur gardener.

**Report of the government horticultural experimental fields in South Holland for 1908**, C. H. CLAASSEN ET AL. (*Verlag Rijkstuinbouwproefvelden Zuid-Holland, 1908, pp. 120*).—Data are given for 161 cooperative cultural, variety, fertilizer, and spraying experiments with fruits and vegetables conducted at various localities in South Holland in 1908, under the direction of the professor of horticulture at Boskoop. Several experiments are also reported in which fruit grown in paper sacks was compared with fruit grown without such protection.

**Contribution to the physiology of the graft. Influence of the stock on the scion**, G. RIVIÈRE and G. BAILLIACHE (*Jour. Soc. Nat. Hort. France, 4. ser., 10 (1909), Feb., pp. 133-135*).—Analytical data secured in 1908 are given of the must of grapes of *Chasselas musqué* grown upon its own roots and upon 10 different stocks, which appear to show, as the authors previously found in investigations with apples and pears (E. S. R., 19, p. 539), that the stock has a

decided influence in either enhancing or detracting from certain characteristics of the scion, which in this instance is indicated by variations in the sugar and acid content of the must.

New experiments in fertilizing grapes, J. STOKLASA (*Wiener Landw. Ztg.*, 59 (1909), No. 18, p. 182, figs. 3).—In fertilizer experiments with grapes conducted at the Agricultural Physiological Experiment Station, at Prague, Bohemia, the plat manured with a combination of superphosphate and kainit gave larger yields of fruit and a higher sugar content in the must than the unfertilized plat. A complete fertilizer, composed of superphosphate, kainit, and ammonium sulphate, gave still better results.

The history of viticulture with special reference to the Rhenish Palatinate, F. BASSELMANN-JORDAN (*Geschichte des Weinbaus unter besonderer Berücksichtigung der Bayerischen Rheinpfalz. Frankfort-on-the-Main, 1907, vols. 1, pp. 350, pls. 10, figs. 66; 2, pp. 351-690, pls. 7, figs. 45; 3, pp. 691-962, pls. 4, figs. 27*).—This extensive work may well be considered an encyclopedia of German viticulture.

Part 1 contains a general historical account of grape growing in Germany from the earliest period to the present time. Part 2 consists of a detailed historical study of grape growing and wine making. Part 3 discusses the various obstacles which have confronted German viticulture, of which the chief is shown to have been man by means of war, abuse of taxation, cultural restrictions, wine falsification, etc. Part 4 treats of the history of wine utensils, and of different kinds of wine, and contains a considerable amount of data relative to the cost of production, wages, yields, and returns in different periods. In part 5 the author has brought together and arranged in chronological order a vast number of more or less brief notes gleaned from documents of various kinds on wine growing, meteorological data, and wine prices covering a period of several centuries. Part 6 deals with the statistics of the wine trade and wine consumption. Part 7 concludes the work with an extensive bibliography of viticultural literature.

Date varieties for the Southwest, J. E. COIT (*Pacific Rural Press*, 77 (1909), No. 11, pp. 201, 210, figs. 2).—Descriptions are given of 3 Arizona-grown seedling dates which appear to be sufficiently valuable to warrant further propagation.

Scheme for the classification of the races of olives grown in southern Italy, M. MARINUCCI (*Schema di Sistemazione delle Razze d'Olio Coltivate nell'Italia Meridionale. Naples, 1908, pp. 18*).—The author presents a system for classifying olives according to the shape of the fruit in which they are grouped under 5 main types: Fusiform, circular oblong, elliptical oblong, elliptical, and obovate. They are again subdivided into regular obtuse and acute, and irregular obtuse and acute. In the final subdivision they are classified as pure-bred and mongrel.

The coffee tree, E. P. DIESELDORFF (*Der Kaffeebaum. Berlin, [1909], pp. 36, fig. 1*).—This pamphlet contains practical notes on coffee culture in northern Guatemala.

The mangoes of Bhagalpur, E. J. WOODHOUSE (*Dept. Agr. Bengal, Quart. Jour.*, 2 (1909), No. 3, pp. 168-187).—Horticultural descriptions are given of a large number of varieties of mangoes, including those commonly found in the market at Bhagalpur as well as several received from the Sabour Experimental Farm. The characteristic shapes of the different varieties described are indicated by outline drawings.

The book of the pansy, viola, and violet, H. H. CRANE (*New York and London, 1907, pp. VIII+106, pls. 15, figs. 1*).—This popular work treats in

detail of the methods of growing various kinds of pansies and violets, both for general purposes and for exhibition.

**Classified list of daffodil names, 1908** (*London: Roy. Hort. Soc., 1908, pp. 51*).—This consists of an alphabetical list of all known daffodils, prepared by the Royal Horticultural Society of London. The different varieties are placed in one of 7 arbitrary divisions, based principally on measurements, as follows: Long trumpets, short trumpets, large cups, small cups, flat cups, doubles, and bunch-flowered. This system of classification is commended for trial for garden and show purposes.

**The encyclopedia of gardening, T. W. SANDERS** (*London [1909], 13. ed., pp. XV+466*).—This work consists of a dictionary of plants generally cultivated in gardens. It gives in alphabetical sequence the culture and propagation of hardy and half-hardy plants, trees and shrubs, orchids, ferns, fruits, vegetables, hothouse and greenhouse plants, etc., including the specific and common names. The present edition has been revised and brought up to date relative to cultural methods, varieties, nomenclature, etc.

**Garden design—comparative, historical, and ethical, T. H. MAWSON** (*Jour. Roy. Hort. Soc. [London], 34 (1909), No. 3, pp. 361-372, 378-383, figs. 6*).—This consists of two lectures on the above subject delivered before the Royal Horticultural Society in September, 1908.

**The practice of garden design, T. H. MAWSON** (*Jour. Roy. Hort. Soc. [London], 34 (1909), No. 3, pp. 384-393, figs. 2*).—The third lecture on the series noted above, in which the author offers several suggestions on the practical development of garden design.

**The Royal Botanic Gardens, Kew, W. J. BEAN** (*New York, Paris, London, Toronto, and Melbourne, 1908, pp. XX+222, pls. 60*).—This work contains a historical account of the Kew Botanic Gardens, together with a discussion of its aims, its work, and the leading principles on which it is conducted. Part 1 deals with the origin and development of the Royal gardens. Succeeding portions of the work discuss in detail English landscape gardening at Kew, Kew in its scientific aspects, plant collections (tropical and warm temperate), and the hardy plant collections. The work is well illustrated by reproductions in color and half-tone photographic plates.

**A park system for the city of Cincinnati, G. E. KESSLER** (*Cincinnati: Board of Public Service, 1907, pp. 54, pls. 15, figs. 6, maps 8*).—This consists of a comprehensive plan for parks and parkways in Cincinnati, prepared by the author at the instance of the Cincinnati Park Commission. Maps and illustrations are given showing the proposed park system as a whole and the treatment of various sections.

## FORESTRY.

**Trees, H. M. WARD** (*Cambridge, 1908, vol. 4, pp. 161, pl. 1, figs. 147*).—This is the fourth volume of a series by the author, which was designed as a handbook of forest botany for the woodlands and the laboratory. Its publication was interrupted by the death of the author. The present volume treats of fruits, the previous ones treating of buds, leaves, flowers, and inflorescences (*E. S. R., 17, p. 255*).

**The trees of Great Britain and Ireland, H. J. ELWES and A. HENRY** (*Edinburgh, 1909, vol. 4, pp. VIII+713-1000, pls. 64*).—This is volume 4 of an extensive treatise which is being issued on the trees either native to or cultivated in Great Britain and Ireland (*E. S. R., 20, p. 340*). The volume, like the previous volumes, is divided into 2 parts.

In part 1 the varieties and species of the following genera are considered relative to their history, botany, distribution, cultural requirements, uses of the timber, etc.: *Abies*, *Pseudotsuga*, *Castanea*, *Fraxinus*, *Zelkova*, *Celtis*, *Alnus*, *Betula*, and *Diospyros*. Descriptions are also given of specimen trees growing in Great Britain. Part 2 is made up of illustrations and botanical drawings of the trees discussed in part 1.

**Woods and forests in Jamaica**, W. FAWCETT (*West India Com. Circ.*, 23 (1908), Nos. 265, pp. 561-562; 266, p. 586; 267, pp. 609-610; 24 (1909), Nos. 268, p. 11; 269, pp. 36, 37; 270, pp. 58, 59; 271, p. 82; 272, p. 106).—The author briefly discusses the important features involved in the management and exploitation of forests, and gives a reference list of some of the more important native timbers of Jamaica as well as such foreign timbers as might be grown to advantage. Each species of wood is briefly described relative to its distinguishing characteristics, economic value, and uses.

**Micrography of the woods of Javanese trees**, J. W. MOLL and H. H. JANS-SONIUS (*Mikrographie des Holzes der auf Java vorkommenden Baumarten*. Leyden, 1906, vol. 1, pt. 1, pp. 368, figs. 44; 1908, vol. 1, pt. 2, pp. 369-568, figs. 30; vol. 2, pp. 160, figs. 21).—The authors have conducted since 1903 an extensive investigation relative to the wood anatomy of Javanese species of trees. In the 2 volumes thus far published descriptions are given of the wood anatomy of some 230 species. Under each description is given the important literature of the species, notes on the material used in the study and its preparation, the reagents employed, and a detailed micrographical description of the wood and its component elements. Figures are given showing the sections of all dissimilar woods. Introductory chapters in volume 1 discuss the methods employed in the investigation, the preparation of the material, the nomenclature used, etc.

**The pines of Mexico**, G. R. SHAW (*Boston*, 1909, pp. 29, pls. 22, map 1).—This paper, which is the first of a series of publications of the Arnold Arboretum, consists of a systematic classification, botanical descriptions and drawings of the Mexican species of pines. The paper is based upon specimens collected by representatives of this Department and of the National Museum, and submitted to the author for identification, together with personal studies of these pines in their native country. Reference is given to the literature on the various species as well as to the different collectors and the specimen numbers in the National Museum. The author finds that numerous forms previously described as distinct species are but several varieties of a few species.

**Monterey pine**, F. ALBERT (*El Pino de Monterey, Pinus insignis o mejor Pinus radiata*. Santiago de Chile: Min. Indus., 1908, pp. 26, figs. 19; An. Agron. [Santiago de Chile], 3 (1908), No. 2-3, pp. 376-399, figs. 19).—A monograph on this species of pine with special reference to its culture in Chile. A list is given of its common names and synonyms, and the species is discussed relative to its botany, habitat, range, geographical distribution, the timber and its uses, climatic and soil requirements, methods of propagation, and silvicultural treatment.

**Canary Islands pine**, F. ALBERT (*El Pino Tea de las Canarias o Pinus Canariensis*. Santiago de Chile: Min. Indus., 1908, pp. 36, figs. 14; An. Agron. [Santiago de Chile], 3 (1908), No. 2-3, pp. 333-366, figs. 14).—A monograph on this species of pine similar to the one noted above.

**Sand-binding plants**, V. S. IYER (*Indian Forester*, 35 (1909), No. 2, pp. 82-97).—The author gives a brief survey of attempts made in different countries and at different times to bind drifting sand, discusses climatic and other influences affecting plant growth in sandy regions, and describes several

peculiarities of root systems, stems, leaves, flowers, etc., of sand-binding and other maritime plants. A list is also given of typical sand-binding plants.

Timber, J. R. BATERDEN (*London, 1908, pp. 351, figs. 54*).—A practical work consisting of descriptive notes on the economic timbers of various countries, together with a discussion of subjects of importance to the timber industry, including the causes of decay and destruction, seasoning and impregnation, defects in timber, strength and testing, and "figure" in timber. The work is based upon the author's personal experience, supplemented by information secured from various authentic sources. A bibliography is appended.

Planting and care of a forest of evergreens, A. KNECHTEL (*Dept. Int. Canada, Forestry Branch Bul. 2, pp. 8, figs. 3*).—A brief, popular bulletin on this subject which discusses the collection of seed, nursery practices, planting operations, thinnings, and the final cut.

The new planting method in forests, M. KOZESNIK (*Die neue Pflanzungs-Methode im Walde. Vienna, 1908, 3. ed., pp. 19, figs. 6*).—This is the revised edition of a short paper on this subject which was first published several years ago, and in which the author recommends and describes in detail a method of planting young trees which closely corresponds to the careful methods employed by private gardeners in setting out plants.

Forest valuation and forest statics, H. STOETZER (*Waldwertrechnung und Forstliche Statik. Frankfort-on-the-Main, 1908, 4. ed., pp. VIII+248*).—This is a manual of forest valuation and statics. In the introduction consideration is given to the importance, historical development, and literature of these subjects. Part 1 contains a general discussion of worth and price and treats in detail of the fundamental principles, execution, and application of forest valuation. Part 2 discusses forest statics relative to methods of estimating and their application.

Is permanent forestry justified from a financial point of view? K. FREDENBERG (*K. Landtbr. Akad. Handl. och Tidskr., 47 (1908), No. 5-6, pp. 289-311*).—The results obtained in the management of a number of Swedish crown forests are given with the view of supporting an affirmative answer to the above question.

Report of the Pennsylvania Department of Forestry for the year 1907 (*Rpt. Penn. Dept. Forestry, 1907, pp. 197, pls. 19*).—This report includes a statement of the general operations of the department of forestry and of specific forest administration by foresters and other officers of the department, together with several papers dealing with practical phases of forestry.

Report of the superintendent of forestry, R. H. CAMPBELL (*Dept. Int. Canada, Ann. Rpt., 1908, pt. 7, pp. 46, pls. 12*).—In addition to a general report of forest operations of the forestry branch of the Canadian Department of the Interior for the year 1907-8, reports are given by the officials in charge of the different divisions of the work.

The Dominion forest reserves, A. KNECHTEL (*Dept. Int. Canada, Forestry Branch Bul. 3, pp. 19, pls. 4*).—This bulletin contains a general account of the Dominion forest reserves relative to their purpose and administration. The following phases are discussed: Location and area, dates of formation, grazing on forest reserves, protection against fire, reforestation, removal of squatters, marking reserve boundaries, forest survey, kinds of timber, timber estimates, removal of timber, and the reserves as pleasure resorts.

Report of the Rocky Mountains Park of Canada, H. DOUGLAS and N. B. SANSON (*Dept. Int. Canada, Ann. Rpt., 1908, pt. 5, pp. 26, pls. 27*).—This report embraces the annual reports of the superintendent of the Rocky Mountains Park, Yoho Park, and Glacier Park reserves, and of the curator of the museum, for the fiscal year ended March 31, 1908. The meteorological data for the year,

and numerous plates illustrating plant life and various scenes in the parks are appended.

Report on the reforestation of waste lands in southern Ontario, 1908. E. J. ZAVITZ (*Toronto: Ontario Dept. Agr., 1909, pp. 28, figs. 21*).—In this report the author describes and gives maps of the various districts of southern Ontario, discusses the present condition of the waste lands, and presents figures to show the financial possibility of artificially reforesting these lands at a profit. The conclusion is reached that on large areas where no seed trees of commercial species exist, it will be impossible to obtain satisfactory new natural growth within a reasonable time, and the policy of putting these lands under forest management is advocated.

Report of the superintendent of forestry, R. S. HOSMER (*Rpt. Bd. Comrs. Agr. and Forestry, Hawaii, 5 (1908), pp. 11-55*).—This is the customary annual report of the division of forestry. It discusses the present status of the forest reserves, the progress made in forest extension, miscellaneous forest work, the present status of rubber in Hawaii, and results of rubber tapping tests, which have been noted from another source (*E. S. R., 20, p. 844*). Reports of the district foresters and the forest fire service are also included, together with a summary of recommendations for further development of the work.

Report of the forest nurseryman, D. HAUGHS (*Rpt. Bd. Comrs. Agr. and Forestry Hawaii, 5 (1908), pp. 56-62*).—A progress report on the work at the government nursery, the forestry experiment station at Makiki, the Nuuanu Station, and the Tantalus Forest, including a statement as to advice and assistance rendered for the year ended December 31, 1908.

Annual report of the director of forestry of the Philippine Islands for the period July 1, 1907, to June 30, 1908, G. P. AHERN (*Ann. Rpt. Dir. Forestry P. I., 1908, pp. 26*).—A progress report on the work conducted during the year by the divisions of administration and investigation, including a discussion of new legislation and miscellaneous matters pertaining to the Philippine forest service. The appendix contains tabular data relative to licenses, registration of woodlands, utilization of forest products, timber cut by leading licensees, important timbers by species, imports and exports, revenues, and expenses.

Para rubber cultivation, C. MATHIEU (*Culture du Caoutchouc de Para. Paris, 1909, pp. II+201, figs. 46*).—This work, which is offered as a manual of rubber cultivation in Malaysia, is printed both in English and in French. Part 1 deals with the problems which confront the prospective settler, such as the selection and acquirement of land, location and construction of dwelling houses and other buildings, methods of living, the labor question, etc. Part 2 discusses rubber culture in detail, including the preparation of the land, nursery practices, planting operations, manuring, pruning and subsequent care, collecting latex, and preparation of rubber for market. Estimates are given relative to yields, expenditures, and returns.

Distribution of [Guayule] rubber in different parts of the shrub, T. WHITTELSEY (*Jour. Indus. and Engin. Chem., 1 (1909), No. 4, pp. 247-249, dgms. 2*).—Analytical methods and data are given of an investigation relative to the distribution of Guayule rubber in different parts of the plant.

In a previous paper on this subject (*E. S. R., 17, p. 257*), Endlich reported that the ratio of the rubber found in the bark to that found in the wood is approximately 7:2. The data secured from the present investigation indicate that the trunk wood contains no rubber, although it does contain a small percentage of a rubber-like resin which might be mistaken for rubber when the extraction is made directly with tetrachlorid. Analyses of the whole plant

gave 9.5 per cent pure rubber on a water-free basis, or, taking the mill weight of the material as a basis, 8 per cent. Inspection of the material prepared for analysis showed that the trunks were made up of 46.4 per cent bark and 53.6 per cent wood. Determinations made of 2 whole plants gave 54.6 and 57.8 per cent of bark, respectively.

[Rubber tapping experiments and mechanical tests of several Surinam woods], W. A. VAN ASBECK (*Dept. Landb. Suriname Bul. 15, pp. 17*).—This bulletin contains the results of tapping experiments conducted with *Hevea guyanensis* in 1908, including analyses of samples of the rubber, and notes on their valuation by different commercial firms. Data are also given on mechanical tests made with 5 Surinam woods.

The direct utilization of latex in the industries, L. MORISSE (*Le Latex: Son Utilisation directe dans l'Industrie. Paris, 1908, pp. 684, figs. 17*).—This work is offered as a résumé of the present state of our knowledge relative to latex. It consists of an exposition of the advantages of the author's secret process of coagulating latex, whereby the coagulated latex may be used directly for manufacturing purposes without first being converted into crude rubber. All of the author's early and recent papers on the subject of harvesting and coagulation of latex are included, together with the reports of the purely scientific latex investigations made by the author's two principal collaborators, V. Henri and G. Vernet.

## DISEASES OF PLANTS.

A method of checking parasitic diseases in plants, M. C. POTTER (*Jour. Agr. Sci., 3 (1908), No. 1, pp. 102-107*).—The author has previously shown (*E. S. R., 13, p. 467*) that the organism causing the white rot of turnips owes its power to the fact that it secretes an enzym which acts upon the cellulose, dissolving the middle lamella and effecting the disintegration of the cell wall, while at the same time it produces a toxin fatal to the protoplasm of its host cell. Subsequent studies with this organism (*Pseudomonas destructans*) have showed that it is possible that the toxin may be one of the waste products of bacterial metabolism.

In a series of investigations, the author grew the organism in cultures, and after considerable growth was made he sterilized the media, filtered it, and steamed it, thus destroying the enzymes and all organisms present. Turnips were then inoculated with the organism causing the white rot, and the prepared toxic solution was employed to determine whether it would check the rot after it had once become well advanced. Cultures were allowed to develop for several days, after which the toxic solution was placed on one half of an inoculated turnip, the other half remaining as a control. On the half receiving the toxic substance the growth of the organism ceased. Where weaker solutions were used the bacteria were found to be unable to grow in the solutions and they prevented further extension of the rot. The toxic solution prepared from the turnip was found not to be necessarily destructive of other organisms.

Some investigations were conducted to determine whether this curative principle would apply in other directions, and cultures were made of *Penicillium italicum* and *P. olivaceum*, which cause the rapid rotting of oranges and lemons. These fungi were grown in sterilized orange juice, and after preparation of the toxic substance a number of oranges were inoculated with the fungus. A few days later, when the characteristic color of the rot had appeared, the oranges were treated with the toxic solution and no further decay was noticed.

**Mucor cultures.** D. R. SUMSTINE (*Science, n. ser.*, 29 (1909), No. 737, p. 267).—A study is reported of the common mold (*Mucor stolonifer*) made to determine the development or nondevelopment of zygospores. In all about 2,000 cultures were examined and not a single zygospore found.

Cultures were made on different media and placed under conditions where oxygen was wanting, to determine the necessity for oxygen in the growth of zygospores, but no zygospores were obtained.

**Further studies on anthracnoses.** C. L. SHEAR and ANNA K. WOOD (*Abs. in Science, n. ser.*, 29 (1909), No. 737, pp. 272, 273).—In continuation of previous studies (E. S. R., 18, p. 1141) 23 forms of *Colletotrichum* and *Gloeosporium* have been studied from different species of plants. Cultures have been made, the fungi compared, and cross inoculation experiments carried on, but no morphological characters have been found to be sufficiently constant to justify the segregation of species except perhaps in the case of the cotton anthracnose. The characters of *Gloeosporium* (*Glomerella*) *rufomaculans* represent fairly well the essential characters of all.

Cross inoculations from forms on fruits seem to indicate that the fungus may soon adapt itself to a different host and after a few generations develop almost as readily on one fruit as on another. All the so-called species are believed to be slightly specialized physiological forms of one omnivorous species.

**Cultures of Uredineæ in 1908.** J. C. ARTHUR (*Abs. in Science, n. ser.*, 29 (1909), No. 737, p. 270).—An account is given of the tenth consecutive season's cultures of various species of rusts made from the resting as well as the summer spores. Among the various facts presented, the author states that for the first time in America the early or brown rust of rye was grown on *Anchusa* sp., being sown early in July. A similar rust on wheat failed to germinate so soon after maturity, seeming to settle the identity of the so-called *Puccinia dispersa* of Europe and America. Trials with the rust of timothy (*P. phleipratensis*) failed to infect barberry plants, in this respect agreeing with European studies.

During the season's investigation considerable information was added regarding the life history of species of *Gymnosporangium*, and the life cycle was demonstrated for one species from the Southern States, one from the Northern States, and one from west of the Rocky Mountains.

**Notes on Sclerospora graminicola.** G. B. TRAVERSO (*Nuovo Gior. Bot. Ital., n. ser.*, 14 (1907), No. 4, pp. 575-578).—A study was made of *S. graminicola*, a common parasite of *Setaria italica*. As a result of inoculation and other experiments, the author concludes that the form commonly occurring on the Italian millet is quite distinct from the species, and he describes it as *S. graminicola setariae-italicae*.

**A leaf blight of beans.** T. FERRARIS (*Riv. Patol. Veg.*, 3 (1909), No. 16, pp. 241-244).—A description is given of a disease of beans in which the leaves become dried and blackened. The cause was found to be the fungus *Alternaria brassicae phaseoli*, and the disease is said to have occurred rather widely in Italy during 1908 and to have caused considerable loss. A wet spring followed by high temperatures in June and July is said to favor the development of the fungus. For the prevention of its attack spraying with Bordeaux mixture or soda Bordeaux mixture is recommended.

**Artificial cultures of Phytophthora** with special reference to oospores. G. P. CLINTON (*Abs. in Science, n. ser.*, 29 (1909), No. 737, pp. 271, 272).—In a previous report (E. S. R., 18, p. 48) the author gave the results of investigations with species of *Phytophthora*. In the present account he gives notes on the absence of oospores from potato mildew and their presence in other species of *Phytophthora*, due possibly to distinct sexual mycelia. This is indicated by observations that the antheridia and oogonia of the other two species (*P. phase-*

*oli* and *P. thalietri*) are borne on separate mycelial threads. During the investigations the author cultivated pure growths of the Lima bean mildew and found that in mixed cultures oospores were always produced. Cultures are now being carried on to obtain mycelia from single spores, and if the theory of sexual mycelia is correct, these should produce no oospores.

Studies of the potato fungus (*Phytophthora infestans*), L. R. JONES and N. J. GIDDINGS (*Abs. in Science, n. ser.*, 29 (1909), No. 737, p. 271).—The authors state that pure cultures of the potato-rot fungus have been maintained for 4 years in the laboratories of the station. Sealed gelatin cultures have been maintained for 7 months, remaining alive but slow in starting growth.

Some noteworthy morphological characters have been observed, among them haustoria-like branches in potato tissue, the abundance of cell partitions in old cultures, an apparent differentiation into two strains, one exceeding the other in vegetative vigor, and oogonia-like bodies produced sparingly on certain media and frequently on others.

It was found that infection normally occurs through the eyes of the tubers before digging and in storage, but occasionally through wounds or lenticels. Wide differences were found between different varieties as to the ease of leaf infection and subsequent rate of spread, which leads to the conclusion that the disease resistance of the leaves may reside in the mesophyll as well as in the epidermal tissues.

Similar differences occur in the rate of development upon sterile blocks cut from the interior of the potato tubers, and these differences are not due to the acid reaction of the cell sap.

A disease of tomatoes, V. VERA (*Prog. Agr. y Pecuário*, 15 (1909), No. 613, pp. 64-66, fig. 1).—An account is given of a disease of tomatoes due to the fungus *Septoria lycopersici*. The effect of the disease on the different parts of the plant is noted with suggestions for its control. It is stated that the form present in Europe differs from that originally described as coming from Argentina and that the former is probably *S. lycopersici europæa*.

Studies of two species of *Glœosporium*, E. LASNIER (*Bul. Trimest. Soc. Mycol. France*, 24 (1908), No. 1, pp. 17-43, pls. 3).—Studies were made of *G. cattleyæ* found on the leaves of certain species of *Cattleya*, and of *G. musarum* on banana fruits.

The morphological and biological characters of each fungus are described, and the author concludes that they are both saprophytes. The perfect form of neither species has been recognized. The characteristics, as shown in culture media, are described at length. The species occurring on orchids somewhat resembles that described by Cooke and Massee under the name *G. vanillæ*. That occurring on the banana is strictly saprophytic, attacking the fruits only after they have attained complete maturity.

Investigations on the development of *Glœosporium nervisequum*, A. GUILLIERMOND (*Rev. Gén. Bot.*, 20 (1908), Nos. 238, pp. 385-400, pls. 3, figs. 5; 239, pp. 429-440, figs. 5; 240, pp. 449-460, pls. 6).—A detailed study is given of the sycamore anthracnose, *G. nervisequum* or *Gnomonia veneta*, as its perfect form is known. The fungus was carefully isolated and cultivated in a number of media, but in none of them was the author able to recognize the yeast forms described by Viala and Pacottet (*E. S. R.*, 18, p. 347). The author thinks that probably these authors had impure cultures and that the yeast and cyst forms were due to the development of some other organism. In other respects the general features of development agree.

Experiences on the control of grape downy mildew in 1908, G. CHAPPAZ (*Prog. Agr. et Vit. (Ed. l'Est-Centre)*, 30 (1909), No. 10, pp. 285-289).—The results of spraying experiments with different fungicides for the control of

mildew in 1908 are described. These experiments were carried on in a field connected with the departmental laboratory at Châlons-sur-Marne, and the meteorological conditions are said to have been exceptionally favorable during the summer for the development of the mildew. After describing the meteorological conditions for the summer of 1908, the experiments are outlined.

In these 8 lots of vines were given different treatments. The fungicides used were neutral copper acetate and ammonia; copper acetate and liquid polysulphids; copper acetate and solid polysulphids; Burgundy mixture, sulphur, and ammonia; and some trade fungicides, the bases of which were chlorate of copper and sulphur, and bisulphite of copper and formalin. Another plot received sodium chlorate as a fungicide. Where no form of sulphur was added to the fungicide the vines received during the summer 2 or 3 applications of sublimed sulphur. In addition to the above fungicides, a test was made of a solution of sea salt, but this proved of no value as a fungicide.

In comparing the different treatments, it was found that the mixtures of neutral copper acetate and polysulphids gave the best results. In comparing the simple with the compound mixtures, the advantage was in favor of those fungicides which were compounded, receiving sulphur or polysulphids.

**The mildews of the grape, I. B. P. EVANS** (*Transvaal Agr. Jour.*, 7 (1909), No. 26, pp. 213-217, pls. 2).—Descriptions are given of the downy mildew (*Plasmopara viticola*) and the powdery mildew of the grape (*Uncinula spiralis*), and for their control it is recommended that Bordeaux mixture be used for the downy mildew and sulphur for the powdery mildew.

**Note on the European apple-tree canker fungus, I. B. P. EVANS** (*Transvaal Agr. Jour.*, 7 (1909), No. 26, p. 217).—A brief note is given on the occurrence of the apple-tree canker fungus (*Xectria ditissima*) in southern Africa.

**Diseases of the olive, L. NAVARRO and E. NORIEGA** (*Prog. Agr. y Pecuaria*, 15 (1909), Nos. 611, pp. 31-33, figs. 3; 612, pp. 47-49, figs. 2).—An account is given of some new and little known fungus and insect injuries of the olive that have been observed by the authors in Seville, Spain. Among the principal fungi noted are *Glaosporium olivarum*, *Macrophoma dalmatica*, and *Cycloconium oleaginum*. In addition there are notes on the tuberculosis of the olive, the olive fly (*Dacus oleæ*) and *Diplosis oleisuga*.

**The injurious action of calcium cyanamid on olive trees, F. FRANCOLINI** (*Italia Agr.*, 1909, No. 1, pp. 12-14, pl. 1; *abs. in Riv. Patol. Veg.*, 3 (1909), No. 17, p. 268).—The results of 3 years' experiments are given showing the effect of calcium cyanamid on olive trees.

In 1906 one lot of trees was fertilized with 2 kg. of Thomas slag, 2 kg. of land plaster, and 1 kg. of calcium cyanamid. The check lot received 1 kg. of nitrate of soda as the source of nitrogen, and the same amounts of the other fertilizers as were given the test trees. Similar comparisons were made between nitrate of soda and calcium cyanamid in 1907 and 1908.

In every case the calcium cyanamid proved injurious to the trees, the injury being characterized by a browning of the foliage, the change of color progressing from the tip of the leaf toward its base. Later the trees lost considerable of their foliage and a large proportion of the fruit dropped from the trees. In clay soils and those rich in humus, the injury was not as pronounced as where the trees were grown in volcanic soils, which were poor in clay and lime.

**A bacterial disease of the peach, J. B. RORER** (*Mycologia*, 1 (1909), No. 1, pp. 23-27).—According to the author, during the past 5 or 6 years peach growers in various sections of the country have called attention to a shot-hole disease of peaches which in wet seasons has caused a great deal of premature defoliation.

This was believed to be of bacterial origin and was so reported by Clinton in 1903 (E. S. R., 16, p. 62). The disease was again noticed in 1905, and in 1906, 1907, and 1908 the author undertook a detailed study of it throughout the South and Middle West. In these sections it proved to be the commonest shot-hole disease of peach leaves, the *Cercospora* leaf spot being but rarely met with. Numerous investigations showed that the disease was of bacterial origin. A bacterial disease of peach twigs and of the fruit was also found, and it seems probable that they, as well as the leaf spot, are caused by the same organism.

During the summer of 1907 a series of successful inoculation experiments with the organism was made. There appears to be but little doubt that the organism causing the leaf spot is the same as that described by Smith as *Bacterium pruni*, the cause of the bacterial black spot of plums and a plum leaf spot (E. S. R., 17, 157).

As the fruit spot was not discovered until toward the close of the peach season, little work has been done upon it.

The immunity of *Coffea congensis* to *Hemileia vastatrix*, M. DUBARD (*Jour. Agr. Trop.*, 8 (1908), No. 90, pp. 363, 364).—A description is given of the variety *chaloti* of *C. congensis*, which is grown at the experiment station at Tamatave, Madagascar, and which has proved to be decidedly resistant to attacks of *H. vastatrix*. This variety seems to have originated from seed that has been under observation for a number of years in Madagascar, the original coming from the Kongo region of Africa. The variety seems not only more immune, but is of decidedly better quality than the Liberian coffee, and it is believed that it can still be improved by breeding experiments.

Witches' broom disease of cacao, C. J. J. VAN HALL and A. W. DROST (*Rec. Trav. Bot. Néerland.*, 4 (1908), No. 4, pp. 243-319, pls. 17; *Jour. Bd. Agr. Brit. Guiana*, 2 (1909), No. 3, pp. 126-132; *Roy. Bot. Gard. Kew, Bul. Misc. Inform.*, 1909, No. 5, pp. 223, 224).—A study on the origin, nature, and treatment of the witches' broom disease of cacao as it occurs in Surinam is reported.

The symptoms of the disease are summarized, from which it appears that the witches' brooms are hypertrophied branches, considerably thickened at the base, with rough surfaces. They are further distinguished by the leaves being small and stunted. Another form of the disease is characterized by the hardening of the pods, a symptom not originally associated with this disease, but usually attributed to the fungus *Phytophthora omnivora*. The third manifestation of the disease is what is designated as "star flowers." These are borne on fruit branches which present the same pathological symptoms as the witches' brooms, but they appear as an agglomeration of a large number of flowers, having among them vegetative branches transformed into small witches' brooms. They seldom give rise to ripe pods.

The disease, according to the authors, has been found to be due to the fungus *Colletotrichum luxificum*, a description of which is given.

The effects of the disease are chiefly shown in the reduction of the crop, and for its prevention severe pruning, after which the trees are to be sprayed with Bordeaux mixture, is recommended. The pruning in some of the experiments amounted to practically the cutting away of the entire top of the tree, after which all the diseased material was burned. This drastic treatment resulted in the practical loss of the crop for a year or two, but the tree recovered, and in a few years had grown well-developed tops.

So far as the authors' investigations go, other species of trees are not subject to the attack of this species of *Colletotrichum*, as has been currently reported.

Root rot, A. DESPEISSIS (*Jour. Dept. Agr. West. Aust.*, 17 (1908), No. 1, pp. 534-540, pls. 2).—According to the author, considerable trouble is reported in different parts of West Australia, due to the root rot of various orchard and

other trees. Investigation showed that most of it is caused by various species of mushrooms, the one most particularly concerned being the honey agaric (*Agaricus melleus*).

For the prevention of injury, the clearing of lands, in which all roots and stumps should be removed, and the draining and cultivation of the newly cleared lands are recommended. When trees are found slightly affected they can be protected to some extent by uncovering the roots, removing the diseased portions, and spraying the sound parts with fungicides.

Observations on the relation of wound parasites to the heartwood of the affected tree, P. SPAULDING (*Abs. in Science, n. ser., 29 (1909), No. 737, p. 272*).—While studying various wood-rotting fungi, the author has noted an apparent relation between the wound parasites and the heartwood of diseased trees. A striking instance of this was that of *Fomes ribis* occurring on sassafras trees. In every case examined this fungus was found attacking the trees only in wounds where the heartwood was exposed by some injury. *F. igniarius*, studied upon the beech, was found to occur in a similar manner. Hundreds of blazed beech trees have been examined, but in not a single instance was the fungus found growing where the wound only extended into the sapwood. On the other hand, it was constantly found in wounds extending into the heartwood. The fungus *Polystictus versicolor* on catalpa and *F. fraxinophilus* on the white ash can be traced to the heartwood through dead stubs or wounds. In a similar way von Schrenk has called attention to the fact that *F. rimosus*, which attacks the heartwood of black locust, enters either through the dead stubs or through insect burrows.

These investigations seem to indicate that the heartwood must be exposed before these fungi are capable of attacking the hosts.

**Rusts on the leaves of bamboos**, S. KUSANO (*Bul. Col. Agr. Tokyo Imp. Univ., 8 (1908), No. 1, pp. 37-50, pl. 1, fig. 1*).—A description is given of 5 species of Puccinia known to occur on bamboos in Japan, the species being *P. phyllostachydis*, *P. sasæ*, *P. kusanoi*, *P. kusanoi azuma*, and *P. longicornis*. Notes are included on the distribution, economic relationship, and some of the biological characters of the different species.

**A new disease of oaks**, A. FIORI (*Bul. R. Soc. Toscana Ort., 3. ser., 13 (1908), No. 9, pp. 266-268*).—A description is given of the mildew of oaks, which was very prevalent in the oidium stage in Europe during 1908. The author thinks that it is probably *Microsphara quercina*, although the fruiting stage has not been found.

**Oak mildew in the southwest of France**, GARD (*Jour. Bot. [Paris], 21 (1908), No. 10, pp. 253-256*).—An account is given of the occurrence of mildew on oak trees in the southwest of France during the summer and autumn of 1908. The species *Quercus tozza* seemed most susceptible, although others were subject to attack. The most injury was done on the young trees, particularly where they were grown as coppice. The season seemed to have been especially favorable to the development of mildews, as the author reports mildews abundant on a number of other species of plants.

**Biology of the chrysanthemum rust**, S. KUSANO (*Bul. Col. Agr. Tokyo Imp. Univ., 8 (1908), No. 1, pp. 27-36, fig. 1*).—A study has been made of the rusts which are known to attack various species of chrysanthemums in Japan, particular attention being paid to the black rust (*Puccinia chrysanthemi*), the white rust (*P. horiana*), and the brown rust (*Uredo autumnalis*).

The author states that there is some question as to the specific name of the first species as well as the host plants attacked. The white rust is of comparatively recent scientific knowledge, although it is said to have been known by gardeners for a considerable time. It proves very destructive, particularly on

some forms of chrysanthemums, and is much more injurious than the black rust because of its attacking the host plants while quite young and also on account of its rapid propagation. The repeated use of Bordeaux mixture is said to be very effective in preventing this rust.

All of the rusts mentioned occur on the wild chrysanthemum (*Chrysanthemum decaisneanum*). They also have a tendency to occur on *C. sinense*, although in some parts of Japan there seems to be more or less specialization regarding their hosts.

A bacterial gall of the daisy and its relation to gall formations on other plants, C. O. TOWNSEND (*Abs. in Science, n. ser., 29 (1909), No. 737, p. 273*).—Investigations on the galls occurring on the Paris daisy have been carried on for some time by the author. After repeated efforts an organism was isolated, which has the ability to induce the formation of new galls upon healthy plants when inoculated into the stems and branches or even into the leaves of healthy daisy plants.

This organism will also produce galls upon a large number of other plants, including the tomato, potato, tobacco, sugar beet, hop, carnation, grape, raspberry, peach, and apple. The work has led to the isolation of pathogenic organisms from the galls of peach, the hard gall of apple, hairy root of apple, hop, rose, and chestnut. The organisms obtained from these galls are cross inoculable and are very similar if not identical in size, shape, structure, and habits of growth with the organism from the daisy gall.

These investigations, the author claims, leave no doubt regarding the cause of the crown gall of the peach as well as of some of the gall formations upon the apple and other economic plants.

Leaf spot of *Odontoglossum*, M. C. POTTER (*Gard. Chron., 3. ser., 45 (1909), No. 1158, pp. 145, 146, figs. 4*).—The attention of the author has been directed to numerous black spots occurring on the lower surface of the leaves of *O. uroskinneri*. The spots are found chiefly on the older leaves, the younger ones being almost, if not entirely, unaffected.

Transverse sections through the region of the spots show an accumulation of a brown mucilaginous or gummy substance beneath the epidermis. In the initial stages this substance is present only in the respiratory cavities of the stomata, from which it exudes into the stomatal openings. In more advanced stages it collects in large masses, spreading through the hypodermal cells into the internal tissues of the leaves.

This leaf spot disease is said to differ in many respects from the common leaf spot of orchids, which is characterized by the plasmolysis of the cells.

No fungus has been found associated with this leaf spot, but numerous bacteria are present in the affected tissues. Thus far all attempts to induce the disease upon healthy plants by inoculation with bacteria have proved unsuccessful, but the author believes that bacteria play an important part in the development of the disease, particularly in the formation of the gum. It is thought that unsuitable cultural conditions are also largely responsible for the initial occurrence of the disease.

The transmissibility of the cause of olive tuberculosis to the oleander, L. SAVASTANO (*Bol. Arbor. Ital., 4 (1908), No. 2, pp. 86, 87*).—As a result of inoculation experiments with pure cultures of the organism causing olive tuberculosis and of the insertion of fragments of olive tubercles into healthy oleander trees, the author states that the bacterial disease of the olive can not be transmitted to the oleander, as claimed by C. O. Smith (*E. S. R., 18, p. 453*).

Report of the Phytopathological Institute of Wageningen for 1907, J. RITZEMA BOS (*Meded. Rijks Hoogere Land, Tuin en Boschbouwsch., 1908, No. 1, pp. 33-137*).—A description is given of the organization of the institute for the

study of plant diseases and reports made on a number of investigations. The diseases are grouped into nonparasitic, those due to plant parasites, those caused by insects, and those the causes of which are not definitely known.

### ECONOMIC ZOOLOGY—ENTOMOLOGY.

**Economic zoology**, H. OSBORN (*New York, 1908, pp. XV+490, figs. 269*).—An introductory text-book in zoology, with special reference to its applications in agriculture, commerce, and medicine.

**A German-French glossary of anatomical and zoological terms**, R. BLANCHARD (*Glossaire Allemand-Français des Termes d'Anatomie et de Zoologie. Paris, 1908, pp. VII+298*).—In this glossary the French equivalents with family, order, or class to which the species belong are given for the German names of animals.

**Catalogue of the type-specimens of mammals in the United States National Museum, including the Biological Survey collection**, M. W. LYON, JR. and W. H. OSGOOD (*U. S. Nat. Mus. Bul. 62, pp. X+325*).—This catalogue includes all type-specimens of mammals known to be in the U. S. National Museum on July 1, 1908. A total of 1,405 type-specimens are here included, of which 692 are in the collection of the Division of Mammals and 713 in the Biological Survey collection. A list is appended of 26 type-specimens that should be in the National Museum collection but of which no part can now be found.

**The fauna of Mayfield's cave**, A. M. BANTA (*Carnegie Inst. Washington Pub. 67, pp. 114, pl. 1, figs. 13, map 1; abs. in Science, n. ser., 29 (1908), No. 743, pp. 503, 504*).—This cave, located in Monroe County, Ind., was visited by the author on an average of once a week during some 26 months, covering different seasons of the years 1903, 1904, and 1905. The collections made are here recorded under the headings of Mammalia, Pisces, Insecta, Myriopoda, Arachnida, Crustacea, Annelida, Mollusca, and Turbellaria. Of 138 species known to exist in Indiana caves, 110 are recorded from Mayfield's cave. Descriptions by C. F. Adams of 2 new species of fungus flies (*Mycetophila analis* and *M. incerta*) are included. A bibliographic list is given of more than 130 works and papers consulted.

**Annual report of the chief inspector of rabbits**, A. CRAWFORD (*Jour. Dept. Agr. West. Aust., 17 (1908), No. 6, pp. 935-939*).—The total length of rabbit-proof fence erected is said to be 2,023 miles with about 10 miles in the course of erection. Details are given of the work of the year.

**Plague among the ground squirrels of California**, W. B. WHERRY (*Jour. Infect. Diseases, 5 (1908), No. 5, pp. 485-506, pl. 1, map 1*).—The fact that a number of ground squirrels (*Otospermophilus beecheyi*) have been proved to be infected with *Bacillus pestis* in two widely separated sections of the State of California is considered as the most serious feature of the plague situation in this country. The Norway rat (*Mus norvegicus*) was the principal species of rodent caught in traps set well within the burrows of the ground squirrel by employed trappers. The relation between squirrel plague and the origin of certain human cases is said to have been demonstrated. Pathological and bacteriological features of the squirrel plague are here discussed.

**Experiments on the use of *Bacillus pestiscaviæ* as a rat virus**, W. B. WHERRY (*Jour. Infect. Diseases, 5 (1908), No. 5, pp. 519-553*).—In a study made of this species it was found that when ingested by young rats (*Mus norvegicus*) and mice (*M. musculus*) it is acutely pathogenic. A large percentage of adult rats are naturally immune to the infection through the gastrointestinal canal or when infected they subsequently recover.

Outbreak of illness caused by vermin-destroying virus, W. COLLINGRIDGE (*Pub. Health* [London], 22 (1908), No. 3, pp. 94-96).—An outbreak of illness was traced to the virus that had been used for the destruction of rodents.

The birds of Tierra del Fuego, R. CRAWSHAY (*London*, 1907, pp. XL+158, pls. 44, fig. 1, map 1).—Six months were spent by the author in the investigations here reported. In the preface the author briefly considers the flora and fauna including the mammals, fishes, spiders, insects, etc. Birds are the most important fauna of all, although the majority are only summer visitors. Thirteen orders and 79 species of birds are considered.

Nests of the barred owl, red-shouldered hawk, and barn owl on Staten Island, in 1907, J. CHAPIN (*Proc. Staten Isl. Assoc. Arts and Sci.*, 2 (1907-8), No. 1, pp. 3-8).—Notes are given on the habits of *Syrnium varium*, *Buteo lineatus*, and *Strix pratincola*.

The food of some British birds, R. NEWSTEAD (*Jour. Bd. Agr.* [London], 15 (1908), No. 9, Sup., pp. VIII+87).—A memoir based upon 871 post-mortem examinations of the stomach contents and the pellets or castings of 128 species of British birds.

"We find that insects occurred in about 41 per cent of the total number of post-mortem records and pellets. If we eliminate the finches, the hawks and owls, ducks, geese, divers and the oceanic birds from this total, we find that the insects forming the whole or part of the dietary of the remaining birds amounts to between 70 and 75 per cent; and it is important to note that those insects which are included in the injurious group vastly outnumber those which may be considered beneficial, and are almost twice as numerous as the beneficial and the innoxious groups combined."

Philippine ornithological literature, I, R. C. MCGREGOR (*Philippine Jour. Sci., A. Gen. Sci.*, 3 (1908), No. 4, pp. 285-292).—This list of 50 titles is said to be the first of a series of papers having for its final object a complete bibliography of Philippine ornithology.

Notes on a collection of birds from Siquijor, Philippine Islands, R. C. MCGREGOR (*Philippine Jour. Sci., A. Gen. Sci.*, 3 (1908), No. 4, pp. 275-281).—A list with notes on species of birds collected from Siquijor, a coral rock island with an area of about 235 sq. km. (about 91 sq. miles) which lies in close proximity to the large Island of Negros.

Priority and practical entomology, H. M. LEFROY (*Jour. Econ. Biol.*, 3 (1908), No. 4, pp. 105-112).—The author here reviews many of the changes which have been made in the names of insects of economic importance and suggests methods by which the names of the more important insects could be standardized.

Insects: The rôle they play in the transmission of disease, H. ALBERT (*Bien. Rpt. Bd. Health Iowa*, 14 (1908), pp. 136-144).—A general discussion of insect transmission of disease.

How best to control and eradicate insect enemies and pests, F. WHITESIDE (*Bien. Rpt. Mont. Bd. Hort.*, 5 (1907-8), pp. 24-63, figs. 18).—An account is given of the more important insect enemies and diseases of fruits with methods of control. A spray calendar is appended.

New pests we should guard against, E. M. EHRLHORN (*Cal. Fruit Grower*, 38 (1908), No. 1066, pp. 10-13).—Among the insects which have not yet been introduced into California and which are to be guarded against, the author mentions the terrapin scale or peach lecanium (*Eulcanium nigrofasciatum*), scurvy bark louse, the West Indian peach scale (*Aspidiotus pentagonus*), maple scale (*Phenacoccus acericola*), pear tree psylla (*Psylla pyricola*), cigar case bearer (*Colcophora fletcherella*), the bud moth (*Timetocera cecillana*), Japanese apple fruit borer (*Larerna herellera*), pear fruit borer (*Nephopteryx rubri*

*zonella*), gipsy moth, brown-tail moth, squash borer (*Melittia satyriniformis*), peach root borer (*Sanninoides exitiosa*), fall webworm, bagworm, and peach sawfly (*Pamphilus persicum*).

A preliminary bulletin on some economic insects and plant diseases of Indiana, B. W. DOUGLASS (*Indianapolis, Ind., 1907, pp. 28, figs. 8*).—A brief account of the more important insects and plant diseases including methods of treatment.

The principal insects injurious to horticulture during 1906-7, M. H. SWENK (*Bul. Nebr. State Hort. Soc., No. 19, pp. 24, figs. 31*).—In this bulletin, which forms part 1 of the report of the State entomologist, the author considers the insects which have been actively injurious to horticulture in Nebraska during the 2 years ended April 1, 1908. These are the codling moth, lesser apple worm, leaf crumpler (*Mineola indiginella*), white-marked tussock-moth (*Homocampa leucostigma*), apple-tree tent-caterpillar, yellow-necked apple-tree caterpillar (*Datana ministra*), pear slug (*Eriocampoides limacina*), rose slug (*Monostegia rosæ*), leaf-cutter bees (*Megachile* spp.), buffalo tree-hopper (*Ceresa bubalus*), snowy tree cricket (*Oecanthus niveus*), plum curculio, and plum gouger.

Scale insects injurious in Nebraska during 1906-7, H. S. SMITH (*Bul. Nebr. State Hort. Soc., No. 20, pp. 16, figs. 6*).—This bulletin forms part 2 of the report of the State entomologist.

While the San José scale does not occur in Nebraska, several other species are a source of injury. The oyster-shell scale was the cause of considerable injury to apple trees during the 2 years under report. The scurfy scale is not as common as *Lepidosaphes ulmi* and rarely does much injury. The elm-tree white-scale (*Chionaspis americana*) occasionally becomes injurious to the common elm. The pine leaf scale (*C. pinifolia*) is said to be a very common species of both native and cultivated conifers. The cottonwood scale (*C. ortholobis*) has been quite abundant in eastern Nebraska for several years on young poplars, cottonwood, and willow. The cottony maple scale has not been sufficiently abundant during the past 2 years to cause much injury. During the summer of 1907 the western cottony grass scale (*Eriopeltis coloradensis*) became prevalent on wild wheat grass in the southwestern portion of the State. Several parasites of this scale have been bred by the author from the egg sacs, the most common being the dipterous parasite, *Leucopis nigricornis*.

Injurious insects and other animals observed in Ireland during the year 1907, G. H. CARPENTER (*Econ. Proc. Roy. Dublin Soc., 1 (1908), No. 15, pp. 559-588, pls. 6, figs. 10*).—Insects of the year are reported under the following headings: Parasites of domestic animals, corn insects, clover, cabbage, and mangold insects, potato and parsnip insects, tobacco insects, orchard insects, hawthorn insects, and forest insects.

Insect investigations in Mexico, A. KOEBELE (*Hawaii. Planters' Mo., 27 (1908), No. 12, pp. 507-513*).—This is an account of investigations made in Mexico by the author.

The moth borer (*Diatraea saccharalis*) is said to be widely distributed in the country. It is stated that 50 per cent of the eggs deposited are destroyed by a parasite (*Trichogramma pretiosa*). While the pest does not occur in Hawaii, it seems quite probable that it will be sooner or later introduced, as it is a species widely distributed.

The large Mexican sugar-cane leaf-hopper (*Cyrtodisca major*) is said to be injurious in the State of Morelos. The Mexican sugar-cane hopper (*Cyrtodisca* sp.) is widely distributed, breeding throughout the year. Its eggs are destroyed to a large extent by fungus diseases and parasites. Other injurious

insects commonly found in cane fields include an earwig (*Sphingolabis taniata*), the chinch bug (*Blissus leucopterus*), and jassid and fulgorid leaf hoppers.

Report of the entomologist and vegetable pathologist, H. TRYON (*Ann. Rpt. Dept. Agr. and Stock [Queensland], 1907-8, pp. 84-92*).—A brief account is given of the more important insects, insectivorous birds, and plant diseases of the year. These are grouped under insects affecting agricultural crops, useful insects, insects and ticks affecting stock, human ecto-parasites, diseases of agricultural crops, and diseases of horticultural crops. An account is also given of the inspection and disinfection of plants exported and imported during the year.

Annual report of the assistant entomologist, L. J. NEWMAN (*Jour. Dept. Agr. West. Aust., 17 (1908), No. 6, pp. 940-944*).—An account is given of work with parasites of the fruit fly, cabbage aphis, scales, etc., and with lady beetles. The prevalence of and injury by the more important insect pests are briefly considered.

Insects and other Arthropoda collected in the Congo Free State, R. NEWSTEAD, J. E. DUTTON, and J. L. TODD (*Ann. Trop. Med. and Par., 1 (1907), No. 1, pp. 3-113, pls. 6, figs. 21, maps 2*).—Insects of the families Culicidæ, Chironomidæ, Psychodidæ, Simulidæ, Tabanidæ, Sarcophagidæ, Muscidæ (particularly tsetse flies), Hippoboscidæ, Pulicidæ, Cimicidæ, and several families of the Acarina, including Ixodidæ, are included in this account.

A guide to the study of Australian butterflies, W. J. RAINBOW (*Melbourne, 1907, pp. 272, pls. 7, figs. 262*).—A small guide intended for beginners.

Notes on the life histories of certain wood-boring lepidoptera, F. X. WILLIAMS (*Ent. News, 20 (1909), No. 2, pp. 58-62, pl. 1*).—The species here noted are *Vespamina sequoiæ*, *Sesia mellinipennis*, *S. polygoni*, and *Pterophorus baccharides*.

Notes on the study of some Iowa Catocalæ, R. R. ROWLEY (*Ent. News, 20 (1909), No. 1, pp. 12-18*).—Notes on food plants are included in this account.

The fauna of British India, including Ceylon and Burma. Coleoptera (*London, 1906, vol. 1, pp. XVIII+329, figs. 107; 1908, vol. 2, pp. XX+534, pls. 2, figs. 172*).—Volume 1 on the Cerambycidæ is by C. J. Gahan and volume 2 on the Chrysomelidæ is by M. Jacoby.

The distribution of the North American species of *Phytonomus*, R. L. WEBSTER (*Ent. News, 20 (1909), No. 2, pp. 80-82*).—A brief account of the distribution of the weevils belonging to the genus *Phytonomus*.

Notes on Tenthredinoidea, with description of new species, II, III, IV, V, S. A. ROHWER (*Canad. Ent., 41 (1909), Nos. 1, pp. 9-21; 3, pp. 88-92; 4, pp. 106-112; 5, pp. 145-149*).—In these papers species and varieties from Colorado, California, Nebraska, Nevada, New Mexico, Kansas, and the District of Columbia are described as new. The new genus *Protemphytus* is also erected.

A note on the habits of *Aphilanthops*, C. N. AINSLIE (*Canad. Ent., 41 (1909), No. 3, pp. 99, 100*).—The author reports observing the wasp *Aphilanthops taurus* capture and carry away *Pogonomyrmex barbatus* at Albuquerque, New Mexico.

Notes on some Chalcidoidea, J. C. CRAWFORD (*Canad. Ent., 41 (1909), No. 3, pp. 98, 99*). *Megorismus fletcheri* bred from *Nectarophora pisi* at Ottawa, Canada, is described as new. The new genus *Hemadas* is erected of which *Megorismus nubilipennis* is designated as the type species. A table is given for the separation of the various genera of the tribe.

Two new seed-infesting chalcis flies, C. R. CROSBY (*Canad. Ent., 41 (1909), No. 2, pp. 50-55, figs. 2*).—*Prodecatoma phytophaga*, reared from the seeds of the Virginia creeper (*Parthenocissus quinquefolia*), and *Eurytoma rhois*, reared

from seeds of the sumac (*Rhus hirta*), which were collected at Ithaca and Taughannock Falls, N. Y., are described as new to science.

A key to the species of *Prospaltella*, with table of hosts, and descriptions of four new species, L. O. HOWARD (*Ann. Ent. Soc. Amer.*, 1 (1908), No. 4, pp. 281-284).—The species *Prospaltella quercicola* reared from *Aleyrodes gelatinosus*, *P. koebelei* from *Aspidiotus longispina*, *P. citrella* from *Aleyrodes coronatus*, and *P. brunnea* from a species of *Aleyrodes* are described as new to science.

Comparative ethology of the European and North American ants, W. M. WHEELER (*Jour. Psychol. u. Neurol.*, 13 (1908), pp. 404-435, pls. 2, figs. 6).—The author first considers the composition of the European and North American ant fauna. For America north of Mexico 450 species, subspecies, and varieties belonging to 63 genera and subgenera are said to have been listed by the author. As a number of forms remain to be described, it is estimated that the total number will exceed 500. It is considered certain that the North American ant fauna is more than twice as rich as that of Europe. Fossil ants, the nidification of the European and North American ants, the parasitic ants of Europe, and Myrmecophiles are considered at some length.

Honey ants, with a revision of the American Myrmecocysti, W. M. WHEELER (*Bul. Amer. Mus. Nat. Hist.*, 24 (1908), pp. 345-397, figs. 28).—To this account is appended a bibliographical list of 49 titles.

The ants of Casco Bay, Maine, with observations on two races of *Formica sanguinea* Latreille, W. M. WHEELER (*Bul. Amer. Mus. Nat. Hist.*, 24 (1908), pp. 619-645).—Data are included on the habits of some of the species here listed.

The ants of Texas, New Mexico, and Arizona, I, W. M. WHEELER (*Bul. Amer. Mus. Nat. Hist.*, 24 (1908), pp. 399-485, pls. 2).—One hundred and one species, subspecies, or varieties are here considered.

The ants of Porto Rico and the Virgin Islands, W. M. WHEELER (*Bul. Amer. Mus. Nat. Hist.*, 24 (1908), pp. 117-158, pls. 2, figs. 4).—"Of the 65 species, subspecies, and varieties of these insects recorded, 12 have been found only in St. Thomas, 4 only on Culebra, and 21 only on Porto Rico; 11 are common to Culebra and Porto Rico, 5 to St. Thomas and Porto Rico, and 12 occur on all three of the islands."

The ants of Jamaica, W. M. WHEELER (*Bul. Amer. Mus. Nat. Hist.*, 24 (1908), pp. 159-163).—"Of the 40 enumerated forms, 9, or nearly 25 per cent, are well-known cosmopolites, and nearly half of the remainder are widely distributed through the West Indies and adjacent South and Central American countries."

The fauna of British India, including Ceylon and Burma. Rhynchota, W. L. DISTANT (*London, 1908, vol. 4, pp. XV+501, figs. 282*).—This, the fourth volume of the Rhynchota, deals with the Membracidae, Cercopidae, and Jassidae. In the appendix are included such species of the Pentatomidae, Coreidae, and Berytidae as have been added to the Indian fauna since the publication in 1902 of volume 1 of the Rhynchota.

A catalogue of the hemiptera of Fiji, G. W. KIRKALDY (*Proc. Linn. Soc. N. S. Wales*, 33 (1908), pt. 2, pp. 345-391, pl. 1, figs. 5).—This list, based mainly upon collections from 3 islands, increases the number of known Fijian hemiptera from the previous total of 40 species to 202 species. Notes are included on the food plants of some of the species.

Life histories of some Philippine Cassididae, W. SCHULTZE (*Philippine Jour. Sci., A. Gen. Sci.*, 3 (1908), No. 4, pp. 261-271, pls. 6).—Life-history notes are given on the species *Prioptera sinuata*, *P. schultzei*, *Aspidomorpha miliaris*, *Cassida picifrons*, *Metriona trivittata*, and *Lacoptera philippinensis*. The M.

*tririttata* larvæ were often found infested by a fly and pupæ of *A. miliaris* by a chalcidid. The eggs of but one species, *L. philippinensis*, were found parasitized.

**Studies on Aphididæ, I, J. J. DAVIS** (*Ann. Ent. Soc. Amer.*, 1 (1908), No. 4, pp. 251-264, pls. 3).—Studies of the habits, with descriptions of the life stages of *Myzus claragni*, the barberry plant louse (*Rhopalosiphum berberidis*), the yellow clover plant louse (*Callipterus trifolii*), and the red clover aphid (*Aphis bakeri*).

**Phyllaphis coweni, C. P. GILLETTE** (*Canad. Ent.*, 41 (1909), No. 2, pp. 41-45, fig. 1).—Notes are given upon the life history of this species of plant louse. Bearberry (*Arctostaphylos uva-ursi*) is said to be the host plant.

**The Lecanium of Robinia, P. MARCHAL** (*Compt. Rend. Soc. Biol. [Paris]*, 65 (1908), No. 24, pp. 2-5).—After considering the origin of the locust scale (*Lecanium robiniarum*), the author presents the details of a breeding experiment, in which he shows this scale to be a variety of *L. corni*. For this variety he proposes the name *L. corni robiniarum*.

**On Thysanoptera, H. J. FRANKLIN** (*Ent. News*, 20 (1909), No. 5, pp. 228-231).—The genus *Aleurodothrips* is erected for the species *Cryptothrips fasciapennis*. This species has been found feeding upon the eggs, larvæ, and pupæ of the citrus white fly (*Aleyrodes citri*).

**A report on the species of Siphonaptera found within the boundaries of the city and county of San Francisco, Cal., C. Fox** (*Ent. News*, 20 (1909), No. 1, pp. 10, 11).—Seventeen species, representing 9 genera, were recognized among some 17,000 specimens collected.

**Revision of the noncombed eyed Siphonaptera, K. JORDAN and N. C. ROTHCHILD** (*Parasitology*, 1 (1908), No. 1, pp. 1-100, pls. 7).—A bibliography is appended to this revision.

**Two little-known aphids on Carex sp., C. P. GILLETTE** (*Ent. News*, 20 (1909), No. 3, pp. 119-121, pl. 1).—The author reports the collection of an alate viviparous female of *Brachycolus ballii* from *Carex* and presents a description of it. *Callipterus flabellus* was taken in large numbers from a small species of *Carex*. Descriptions of adult apterous viviparous and winged females are accompanied by illustrations.

**The preparatory stages of Euchloe sara, K. R. COOLIDGE and E. J. NEWCOMER** (*Canad. Ent.*, 41 (1909), No. 2, pp. 45-47).—Notes are given upon the life history and habits of this species, which occurs in California on species of *Brassica* and other *Cruciferae*.

**Weevils and other insects affecting grains and cereal products, R. RAMÍREZ** (*Estac. Agr. Cent. [Mexico] Circ.* 5, pp. 5, pls. 6).—A general account of these insects.

**Notes on Contarinia sorghicola, G. W. HERRICK** (*Ent. News*, 20 (1909), No. 3, pp. 116-118, pl. 1).—This cecidomyid is reported as the source of widespread injury to the seed of Kafir corn and sorghum in Texas. Parasites of the species *Aprostocetus diplosidis* were bred in large numbers from it. The pest is difficult to control. It is suggested that the parasites may increase sufficiently as the season advances to enable a late crop of Kafir corn to mature its seed.

**Poisoned bait remedy [for cutworms], C. W. MALLY** (*Agr. Jour. Cape Good Hope*, 33 (1908), No. 5, pp. 628-635, figs. 3).—The remedy here described consists of cutting up any available green stuff as lucern, barley, forage, cabbage or rape leaves, young succulent weeds, etc., into lengths of about  $\frac{1}{2}$  in, moistening with poisoned sweet and scattering broadcast in cabbage, tomato, tobacco, and other infested fields. A mixture of arsenite of soda, 1 lb., molasses or brown sugar, 8 lbs., and water, 10 gal., has been used in which to moisten the green stuff. Ants, and a bacterial disease are mentioned as enemies of cutworms.

Preliminary report upon experiments with powdered arsenate of lead as a boll weevil poison, W. NEWELL and T. C. BARBER (*Crop Pest Com. La. Circ.* 23, pp. 9-40, figs. 3).—The authors first present a brief review of the use of Paris green in combating the boll weevil. At their request one firm attempted and, after some experimentation, succeeded in the spring of 1908 in producing a powdered arsenate of lead. Experiments carried out with this insecticide are reported in which it was found to be twice as effective as Paris green, and that if applied to cotton just before the first squares form 70 per cent of the boll weevils then present would be killed. Conclusions as to the probable profit following such application should be drawn with caution, since all the boll weevils are not out of hibernation when the squares first appear. For the destruction of the cotton caterpillar or leaf worm in midsummer, powdered arsenate of lead is preferred to Paris green since it is equally as effective, is noninjurious to the cotton plant, and is cheaper. Powdered arsenate of lead is also considered a better application for the bollworm than is Paris green.

Destroying the boll weevils before they enter hibernation, W. NEWELL (*Crop Pest Com. La. Circ.* 24, pp. 41-48).—Attention is called to the importance of fall destruction of cotton stalks. Early and complete destruction is shown to be a necessary precedent to the successful use of powdered arsenate of lead the following spring.

What constitutes a perfect stand of cotton when fighting the boll weevil? W. NEWELL (*Crop Pest Com. La. Circ.* 25, pp. 15).—In sections infested by the boll weevil, cotton bolls are not made after August 15 (and oftentimes none after August 1) and therefore each plant requires only enough growing room in which to produce bolls up to the date of maximum infestation, about August 15. Having in mind these facts, the author conducted experiments to determine what constitutes a perfect stand, by this being meant the number of plants on any given area which will give the greatest yield per acre. A summary of the comparative production of widely spaced and closely spaced cotton is presented in the following table:

*Comparative production of cotton in wide rows, in narrow rows, and in rows of medium width.*

Experiment.	Yield of seed cotton per acre.		
	Widely spaced.	Closely spaced.	Medium distance.
	<i>Pounds.</i>	<i>Pounds.</i>	<i>Pounds.</i>
Mansfield, 1907 .....	734	947	892
Mansfield, 1908 .....	838	1,344	993
Mansura, 1908 .....	474	627	392
Bayou Pierre, 1908 .....	380	636	553
Average yield, all experiments .....	607	889	708

These experiments were conducted on such a variety of soils and under such a variety of conditions that the results are considered trustworthy.

"From our own experience we are inclined to believe that spacing about as follows will give the maximum yields per acre under ordinary conditions:

"On poor upland soil, rows 3 ft. apart, plants 10 in. apart in the row. On rich upland or good prairie soils, rows 3 ft. apart, plants 12 in. apart in the drill. For worn, or very sandy bottom lands, rows 3½ ft. apart, plants 12 in. apart in the drill. On bottom lands of medium fertility, well drained, rows 4 ft. apart, plants 15 in. apart in the drill."

**Maize stalk borer** (*Sesamia fusca*), C. W. MALIX (*Agr. Jour. Cape Good Hope*, 33 (1908), No. 5, pp. 616-624, figs. 2).—A general account is given of this pest, including methods of control.

**Insect enemies of cotton**, F. SHERMAN, Jr. (*Bul. N. C. Dept. Agr.*, 29 (1908), No. 6, pp. 54, figs. 24).—This is an account of the more important cotton insects, their biology, injury, and remedies. The author considers \$2,000,000 a conservative estimate of the injury annually done to cotton in North Carolina by insects.

Cutworms are the source of considerable injury, particularly in the Piedmont counties. Of 7 species reared to maturity, 4 are reported as having reached the moth stage in spring, and 2 in fall, while 1 was observed in summer only. Injury by the cotton leaf-louse (*Aphis gossypii*) is said to be rather general throughout the cotton-growing regions of the State. *Aphis maidi-radicis* has been reported from several counties as the source of injury.

The cowpea pod weevil (*Chalcodermus æneus*) was reported in 1907 from several counties as injurious to cotton. The new cotton beetle (*Luperodes brunneus*) has been the source of considerable damage to blooms and squares. The cotton red spider (*Tetranychus glovcri*) has been at times a source of injury, principally in a belt about two counties wide extending across the State from north to south. The cotton worm (*Alabama argillacea*) has not often been destructive in the State. The bollworm while not considered a serious enemy of cotton in North Carolina does some damage every year. The boll weevil is not as yet known to occur in the State. Several cotton insects of lesser importance are also considered.

**Notophallus hæmatopus** attacking peas in France, P. MARCHAL (*Bul. Soc. Ent. France*, 1908, No. 3, pp. 41, 42).—This acarid is described as causing considerable injury to peas near Gien in central France.

Further biological notes on the Colorado potato beetle (*Leptinotarsa decemlineata*), including observations on the number of generations and length of the period of oviposition, A. A. GIRAULT (*Ann. Ent. Soc. Amer.*, 1 (1908), No. 2, pp. 155-178).—A continuation in 1907 at New Richmond, Ohio, of observations made during 1906 in Georgia, previously noted (*E. S. R.*, 19, p. 159).

Contribution to the study of the sugar-cane borers, N. LÉVY (*Bol. Min. Fomento [Peru], Dir. Fomento*, 6 (1908), No. 7, pp. 1-4).—The species *Diatraea striatalis* and *Sesamia nonagrioides* var. *albiciliata* are here considered.

**Paper on the frog hopper**, J. J. MCLEOD (*Proc. Agr. Soc. Trinidad and Tobago*, 8 (1908), No. 12, pp. 552-556).—An account is given of part of the life history of a Trinidad species of cercopid, which the author considers the principal cause of the injury and disease of sugar cane throughout the island. As a remedy it is recommended that the fields be burned over as soon as the canes are cut and that badly infested fields be allowed to lie fallow for at least a year.

**Insects injurious to tobacco**, G. E. ANASTASIA (*Bol. Tec. Cultiv. Tabacchi [Scafati]*, 7 (1908), No. 2, pp. 107-114, pl. 1).—In this article the author considers the Thysanoptera or thrips known to injure tobacco, the nature of their injury, natural enemies, and methods of control.

**A new vegetable pest—the tomato weevil**, C. FRENCH, Jr. (*Jour. Dept. Agr. Victoria*, 6 (1908), No. 12, pp. 754, 755).—*Desiantha novica*, a species of weevil recently described as new, is reported to have fed upon and destroyed great numbers of tomato and other garden plants.

**The Japanese Coccidæ**, T. D. A. COCKERELL (*Canad. Ent.*, 41 (1909), No. 2, pp. 55, 56).—Notes on a number of species.

**The San José scale** (*Aspidiotus perniciosus*) and methods of treatment, A. E. STENE (*Ann. Rpt. Bd. Agr. R. I.*, 23 (1907), App., pp. 1-91, pls. 19, figs.

30).—A general account of this insect including its natural enemies and methods of control.

The fruit-infesting forms of the dipterous genus *Rhagoletis*, with one new species, J. M. ALDRICH (*Canad. Ent.*, 41 (1909), No. 2, pp. 69-73, fig. 1).—Notes and a table are given for the separation of the species of this genus of fruit flies.

Annual report of the chief orchard inspector, T. HOOPER (*Jour. Dept. Agr. West. Aust.*, 17 (1908), No. 6, pp. 933-935).—A remarkable reduction from that of the previous year is reported in the quantity of fruit destroyed by the fruit fly. The use of kerosene for the destruction of these flies is considered as a valuable discovery, as many flies have been destroyed by it. A brief account is given of the more important orchard insects of the year.

Observations on the oviposition of *Æcanthus quadripunctatis* Beutenmüller, J. P. JENSEN (*Ent. News*, 20 (1909), No. 1, pp. 25-28, pl. 1).—Injury to blackberry and raspberry canes is said to be due to *O. quadripunctatis* and not to *O. niveus*.

The woolly aphid of the apple tree, J. R. INDA (*Estac. Agr. Cent. [Mexico]*, Circ. 2, pp. 6, pl. 1).—This is a general account including remedies for *Schizoneura lanigera*.

The apple blossom weevil, W. E. COLLINGE (*Jour. Bd. Agr. [London]*, 15 (1908), No. 9, pp. 674-678).—An account of the life history and bionomics and of preventive and remedial measures for *Anthonomus pomorum*.

[The olive fly and methods of control] (*Ann. Agr. [Italy]*, 1908, No. 256, pp. 34-79).—In the proceedings of the annual meeting of the Consultative Commission of Olive Culture and Oil Manufacture, reports are given by Profs. Berlese, Silvestri, and others on investigations of the value of parasites, sweetened arsenicals, etc., in combating the olive fly and *Lecanium olæ*.

Some new and undescribed insect pests affecting cocoa in West Africa, W. M. GRAHAM (*Jour. Econ. Biol.*, 3 (1908), No. 4, pp. 113-117, pls. 2, fig. 1).—A capsid belonging to an undetermined genus, *Chryphalus horridus*, and *Ceratitis anonæ* are described as new to science.

On a new species of *Kermes* destructive to oak trees in North India, E. E. GREEN (*Ent. Mo. Mag.*, 2. ser., 20 (1909), No. 229, pp. 10-12, figs. 4).—The species here described (*Kermes himalayensis*) is reported as killing oaks (*Quercus incana*) over a considerable area.

The large larch sawfly, C. G. HEWITT (*Jour. Bd. Agr. [London]*, 15 (1908), No. 9, pp. 649-660, pl. 1, map 1).—The author here considers the life history of *Nematus erichsonii*, the nature and effects of its attack, its occurrence, natural enemies, and remedial and preventive measures. Birds and the field vole (*Microtus [Arvicola] agrestis*) are reported to be the most important factors in the natural control of this pest. In two lots of cocoons examined, 3.4 and 9.5 per cent, respectively, were found parasitized by the ichneumon *Mesoleius auticus*.

The Monterey pine resin midge (*Cecidomyia resinicoloides* n. sp.), F. X. WILLIAMS (*Ent. News*, 20 (1909), No. 1, pp. 1-8, pl. 1).—The author here presents an account of the life history and habits of a species new to science.

Biological studies on bark beetles, C. HENNINGS (*Naturw. Ztschr. Forst u. Landw.*, 5 (1907), Nos. 1, pp. 66-75; 2, pp. 97-125; 12, pp. 602-608, fig. 1; 6 (1908), No. 9, pp. 469-486, fig. 1).—In part 1 of this report the biology of *Tomicus typographus* is considered. In part 2, *Ips typographus*, *I. scordatus*, and *Mycophitus piniperda* are briefly considered. Part 3 has been previously noted (*E. S. R.*, 20, p. 559). Part 4 is devoted to a discussion of the life histories and feeding habits of bark beetles.

The fumigation of nursery stock, B. W. DOUGLASS (*Ind. State Ent. Bul.* 2, pp. 9, figs. 3).—During the summer of 1907 over 30 nurseries in Indiana were found infested with the San José scale. The author describes a fumigation house of concrete that was built for a nursery man at a total cost of less than \$100. Photographs are given of the house while under construction and after completion.

Attention is called to the fact that the formula given for fumigation is based upon the chemically pure potassium cyanid and not upon the commercial brand, which averages less than 50 per cent pure. Examinations made of samples of potassium cyanid obtained from nurseries over the State where fumigation is carried on show that as a rule the article sold by the average druggist is of the commercial grade.

Directions are given by the author for the fumigation of stock and by W. C. Reed for the fumigation of buds and scions.

Descriptions of some new species and a new genus of American mosquitoes, H. G. DYAR and F. KNAB (*Smithsn. Misc. Collect.*, 52, No. 1813, pp. 253-266, fig. 1).—The genus *Dianamesus* based upon the new species *D. spanius* which was collected in the Canal Zone, Panama, is described as new to science. Thirty-five species belonging to the genera *Aedes*, *Bancroftia*, *Culex*, *Deinocerites*, *Wyeomyia*, and *Limatus* are also described as new.

Mosquito comment, H. G. DYAR and F. KNAB (*Canad. Ent.*, 41 (1909), No. 3, pp. 101, 102).—*Culex trachycampa* from the Canal Zone, Panama, and *Aedes sansoni* from Banff, Alberta, Canada, are described as new.

On the larval and pupal stages of *Anopheles maculipennis*, A. J. MMS (*Pt. 1, Jour. Hyg. [Cambridge]*, 7 (1907), No. 2, pp. 291-318, pls. 2; *pt. parasitology*, 1 (1908), No. 2, pp. 103-133, pls. 2).—The author presents a detailed description of the internal structure of the larva and pupa of this mosquito. A bibliography is appended to each part.

Biology of Philippine Culicidæ, C. S. BANKS (*Philippine Jour. Sci., A. Gen. Sci.*, 3 (1908), No. 4, pp. 235-258, pls. 10).—Studies were made on the life history and habits of *Worcesteria grata*, *Desvoidya jolansis*, *Stegomyia persistans*, *S. samarensis*, *Hulecætomys pseudotaniata*, the filaria mosquito (*Culex fatigans*), *Banksinella luteolateralis*, *Mansonia annulifera*, and *M. uniformis*. The larvæ of *W. grata* are said to destroy enormous numbers of those of other species. It is the author's opinion that *Mansonia uniformis* plays a rôle in the transmission of dengue fever as important as does *Culex fatigans*.

New Philippine mosquitoes, C. S. LUDLOW (*Canad. Ent.*, 41 (1909), No. 3, p. 97).—A new species of mosquito collected at Parang, Mindanao, P. I., is described as *Oculiomyia fulleri*.

Millions and mosquitoes, H. A. BALLOU (*Imp. Dept. Agr. West Indies Pamphlet* 55, 1908, pp. 16, fig. 1; *West Indian Bul.*, 9 (1909), No. 4, pp. 382-390, figs. 4).—An account is given of a species of small fish (*Girardinus pasciloides*), commonly known as million, which largely assists in keeping some species of mosquitoes in check through feeding upon the eggs, larvæ, and pupæ. This fish has recently been introduced into St. Kitts-Nevis, Antigua, Jamaica, St. Vincent, St. Lucia, and Guayaquil, and also into British Guiana, Colon, and Bolivar.

A note upon the possibility of the mosquito acting in the transmission of leprosy, W. R. BRINCKERHOFF (*Washington, D. C.: Pub. Health and Mar. Hosp. Serv. U. S.*, 1908, pp. 22-24).—The author has found *Culex pipiens* to deferate during the process of blood sucking in a way very similar to *Mucomyia ludlowii* as observed by Banks. Such a habit makes it mechanically possible for mosquitoes to carry lepra bacilli from lepers to well persons and highly

probable that if so carried the bacilli will be rubbed into the skin of the person bitten.

Bibliography on flies and mosquitoes as carriers of disease, W. P. GERHARD (*Ent. News*, 20 (1909), Nos. 2, pp. 84-89; 5, pp. 207-211).—One hundred and nine titles are listed.

A preliminary account of the biting flies of India, H. M. LEFROY (*Agr. Research Inst. Pusa [India] Bul.* 7, 1907, pp. III+45+II, pls. 4, figs. 32).—In this preliminary account the author considers briefly the classification, life histories, and habits of the blood-sucking flies.

A new species of *Ceratophyllus*, C. Fox (*Ent. News*, 20 (1909), No. 3, pp. 107-110, figs. 3).—A new species of flea taken from *Microtus californicus* and also from the nest of a wood rat (*Neotoma* sp.) is here described as *C. multi-dentatus*.

The tumbu-fly (*Cordylobia anthropophaga*), E. E. AUSTEN (*Jour. Roy. Army Med. Corps*, 10 (1908), No. 1, pp. 18-24, figs. 2).—An account of the life history and habits of a fly found in Central and South Africa which in the maggot stage burrows beneath the skin of human beings, monkeys, dogs, and other animals.

Description of two new species of African ticks, G. NEUMANN (*Ann. Trop. Med. and Par.*, 1 (1907), No. 1, pp. 115-120, figs. 4).—*Rhipicephalus duttoni* taken from a bovine at Zambie and *R. longus* from a bovine at Kasongo are here described as new.

The structure and biology of *Hæmaphysalis punctata*, I. G. H. F. NUTTALL, W. F. COOPER, and L. E. ROBINSON (*Parasitology*, 1 (1908), No. 2, pp. 152-181, pls. 5, figs. 9).—An account is given of this European species which is widely distributed, though never very numerous. The great majority of these ticks received by the authors were taken from sheep, though specimens were also received that had been taken from goats and ferrets.

Experimental studies on the transmission of recurrent fever by ticks, B. MÖLLERS (*Ztschr. Hyg. u. Infektionskrankh.*, 58 (1908), No. 2, pp. 277-286; *abs. in Bul. Inst. Pasteur*, 6 (1908), No. 21, p. 964).—Experiments conducted with *Ornithodoros moubata* brought back by Koch from German East Africa are reported. The author presents data on the life history and habits of this tick and reports experiments in which recurrent fever was transmitted to monkeys. Larvæ from infected females were found to transmit the disease.

Spirochetosis transmitted in Tunis by *Argas persicus*, B. GALLI-VALERIO (*Centbl. Bakt. [etc.]*, 1. Abt., Orig., 47 (1908), No. 4, pp. 494, 495).—The author has demonstrated the occurrence of *Spirochæta gallinarum* in Tunis and that *A. persicus* is the active agent in its transmission.

Mycetozoan endoparasites of insects. I, *Sporomyxa scauri*, n. g. and n. sp., L. LÉGER (*Arch. Protistenk.*, 12 (1908), No. 1-2, pp. 109-130, figs. 3).—The species here reported is a parasite of the tenebrionid beetle *Scaurus tristis*. The specimens studied came from Algeria, particularly the province of Oran, where this parasite appears to be widely distributed. As a result of infestation the reproductive organs of the host are said to be destroyed.

The house cockroach, J. R. INDA (*Estac. Agr. Cent. [Mexico] Bol.* 7, pp. 16, pl. 1).—*Ectobia germanica* is the species here considered.

Descriptions and records of bees, T. D. A. COCKERELL (*Ann. and Mag. Nat. Hist.*, 8. ser., 2 (1908), No. 10, pp. 323-334).—A list of fossil Bombiform bees, a general scheme of relationships, and a description of a new fossil species are given. Records of bees collected in Colorado, descriptions of several new species, and a table for the separation of bees in the Foxii group of *Nomia* follow.

Report of State inspector of apiaries, M. E. DARBY (*Missouri Bd. Agr. Mo. Bul.*, 6 (1908), No. 11, pp. 3-13, figs. 6).—During the season of 1908, 340 apiaries and 5,155 colonies were inspected, of which 166 apiaries and 469 colonies were found diseased. A brief account is given of foul brood and other bee diseases.

The hive and honey bee, L. L. LANGSTROTH, rev. by C. DADANT (*Hamilton, Ill.*, 1908, pp. X+575, pls. 28, figs. 229).—A second revision of this work.

A guide to the culture of mulberry trees and to the commercial raising of silkworms, J. BOLLE (*Anleitung zur Kultur des Maulbeerbaumes und zur Rationellen Aufzucht der Seidenraupe*. Görz, 1908, pp. VII+107, pls. 2, figs. 112).—In part 1 the author considers the culture of mulberry trees, their enemies, diseases, etc. In part 2 a detailed account is given of the methods of rearing silkworms, nature and treatment of the diseases affecting them, etc.

Inheritance in silkworms, I. V. L. KELLOGG (*Leland Stanford Jr. Univ. Pubs., Univ. Ser.*, 1908, No. 1, pp. 89, pls. 4, figs. 2).—This is said to be a first contribution of data and results derived from a general study of silkworm inheritance.

### FOODS—HUMAN NUTRITION.

On the presence of tin in certain canned foods (*Local Govt. Bd. [Gt. Brit.], Med. Dept., Rpts. Insp. Foods*, 1908, No. 7, pp. 30).—This document consists of two parts, namely, a report of investigations and a discussion.

*General observations on the inquiry*, by G. S. Buchanan (pp. 1-4).—The investigations reported in the following paper are briefly summarized and discussed.

*On the presence of tin in certain canned foods, together with some investigations on the toxicology of tin*, by S. B. Schryver (pp. 5-30).—The author reports the examination for tin of a large number of samples of canned goods, in many cases five to seven years old. A colorimetric and gravimetric method were used for the estimation of tin, the former depending upon the purple color reaction obtained by the use of dinitro-diphenylamine-sulphoxid with stannous chlorid in the presence of an excess of hydrochloric acid. Under the experimental conditions described 0.25 grain of tin per pound of sample gave a marked color.

The procedure in the gravimetric method employed was for the most part similar to that used for the colorimetric estimation. "The organic matter was destroyed by a mixture of potassium sulphate and sulphuric acid, and the tin precipitated from the diluted solution as sulphid. This was converted into oxid, which was weighed as such instead of being estimated colorimetrically."

As regards the results obtained, "the meat foods, as a class, appeared to have taken up into their substance a comparatively small proportion of tin, even after six years or more. Often the quantity of tin present in these meats has been less than 0.5 gr. per pound; in only one instance (canned tripe) did it reach 2 gr. per pound. Meat extracts of similar age, however, had absorbed a considerably greater proportion of tin, and the same in a less degree was the case with meat essences.

"Only one of the three samples of canned soup of 6 to 8 years old contained tin in large quantities; in this instance the soup no doubt contained fruit acid derived from tomatoes. Canned lobster of 6 to 8 years of age had absorbed as much as 2.39 gr. of tin to the pound. . . .

"The two samples of canned vegetables (parsnips and carrots, 6 to 8 years) showed 1.5 and 2.19 gr. of tin per pound respectively. Canned jams and puddings containing fruit, of the same age, took up considerably more tin than the

meat foods; the apple and plum puddings and a sample of apricot jam contained about 3 grains of tin to the pound. No samples of the canned fruits most commonly consumed in this country (pears, apricots, pineapple, etc.) were included . . . [in the samples examined.] It was satisfactory to find that the highest amount of tin present in samples of canned pears, apricots, and peaches, obtained from a London importer, who specially selected them as old stock and stated them to be between 1 and 2 years old, was not more than 1.03 gr. per pound."

As the author notes, his investigations brought out a fact which he had observed before with meat extracts, namely, "that the tin after solution in the liquid contents of the can, becomes in course of time absorbed in or chemically combined with the solid contents (meat, fruit, etc.) in such a way that the latter contain relatively larger quantities than the liquid itself.

"Other examinations tended to emphasize the important part which may be played by unsatisfactory soldering in connection with high degrees of contamination; . . . It is evident that the presence of solder in the contents of the can may cause very pronounced solution of tin; no doubt owing to electrolytic action. It is possible that unsatisfactory tin plate (e. g., cans which have been so thinly coated on the interior that the underlying metal is at points practically exposed to the action of the contained liquid) may also tend to affect the extent of solution of tin by means of electrolytic action."

In pharmacological studies of which the author himself was the subject tin in the form of a double tartrate with sodium was taken during three weeks. Urine and feces were collected and examined.

"In the one experiment on a human being, the excretion of tin kept pace for a fortnight with the intake, when the latter did not exceed 2 gr. daily. With an increase of dose in the third week, there was some evidence of a cumulative action. . . . There was in all cases relatively small amount of absorption from the alimentary tract, as indicated by the small amounts of metal excreted in the urine. When tin enters the system by a channel other than the alimentary tract, the metal is excreted (at any rate in the case of dogs) in larger quantities in the urine than in the feces. . . .

The data presented . . . "do not indicate much probability of serious risk of chronic poisoning by the absorption of nonirritant compounds of tin as a result of a diet which consists largely of canned foods and is continued over considerable periods of time."

The work of other investigators is summarized and discussed in connection with the experimental data reported and a bibliography is appended to the paper.

The deterioration and commercial preservation of flesh foods. I. General introduction and experiments on frozen beef, W. D. RICHARDSON and E. SCHERUBEL (*Jour. Amer. Chem. Soc.*, 30 (1908), No. 10, pp. 1515-1564).—The general subject of deterioration of meat is discussed and results of experiments reported on the physical and chemical changes which take place when meat is kept in cold storage.

The physical changes in frozen beef may be due to desiccation or to pressure produced by the expansion of water during the freezing process and particularly to the fact that water freezes outside the cell walls. Another physical effect in meat under conditions of storage lies in the contraction of the insoluble tissue elements which takes place even when the moisture remains constant. The temperature at which meat becomes solid depends upon phenomena connected with the lowering of the freezing point of water by the presence of soluble solids and similar constituents.

The evidence from both cultural and microscopic examinations of frozen beef led to the conclusion that bacteria are not capable of penetrating it in this con-

dition. In the chemical work on frozen meat it was the authors' purpose to show whether or not there was a progressive change in the constituents of the meat such as would result in an increase of its soluble constituents and ammoniacal nitrogen. The figures for fresh and frozen samples are very similar, and the variations did not tend definitely in one direction. The authors believe that whenever decomposition of meat occurs to any noticeable extent volatile basic substances are formed, increasing with the degree of decomposition, chief of which is  $\text{NH}_3$  derived from  $\text{NH}_4$  salts.

From their experiments they conclude that no decomposition is shown by the values obtained for ammonia nitrogen and hence that no bacterial decomposition occurred in the stored meat. Frozen beef stored 610 days was in their opinion not different in flavor from fresh beef. The general conclusion is reached that cold storage below  $-9^\circ$  is an adequate and satisfactory method for the preservation of beef for at least 554 days.

Refrigeration and the preservation of meat, U. FERRETTI (*I Frigoriferi e la Conservazione delle Carni. Rome, [1908], pp. 26, figs. 21*).—This article contains a summary and discussion of refrigeration and cold storage with special reference to meat and the use of cold storage meat in the diet.

Food products at the First International Cold Storage Congress, H. BOUVIER (*Rev. Sci. [Paris], 5. ser., 10 (1908), No. 26, pp. 804-808*).—A report of proceedings of the First International Cold Storage Congress, Paris, October, 1908, with special reference to the question of preservation of food.

The preserving of fruits, vegetables, and meat, ROSA ALBERT (*Das Konservieren von Obst, Gemüse und Fleisch. Hanover, 1907, pp. VIII+93, figs. 11*).—This is a second edition of a work on the preserving of foods and is based on the practical experience of the author.

The temperature attained in sterilizing preserved vegetables and fruits, J. KOCHS and R. WEINHAUSEN (*Ber. K. Gärt. Lehranst. Dahlem, 1906-7, pp. 146-161; Pure Products, 4 (1908), Nos. 11, pp. 517-522; 12, pp. 565-571*).—In confirmation of the work of other observers, it was noted that the diffusion of heat in sterilizing canned goods is dependent upon the manner in which the contents are packed. The more solidly the material is packed, and the less fluid in the can, the greater the difficulty with which the heat will penetrate. The results obtained are not regarded as definite enough for final deductions.

In tests with glass and earthenware jars satisfactory results were obtained. Since heating canned goods in a water bath does not make it certain that all of the micro-organisms are killed, the authors believe that fractionated sterilization is sometimes desirable. The great importance of cleanliness in canning is insisted upon.

The manufacture of preserved vegetables, J. OTT (*Die Fabrikation der Gemüskonserven. Leipzig, 1909, pp. VIII+143, figs. 24*).—A general treatise on the canning of vegetables on a commercial scale.

Preserved fruits in Europe, H. L. WASHINGTON and R. P. SKINNER (*Daily Cons. and Trade Rpts. [U. S.], 1909, Nos. 3399, pp. 1-4; 3414, pp. 1-8*).—These consular reports describe French methods of preparing candied fruits and chestnuts.

Canning and preserving, E. K. ELLSWORTH (*Bur. of the Census [U. S.], Manfrs. 1905, pt. 3, pp. 389-429*).—Noted from another source (*E. S. R., 19, p. 166*).

Slaughtering and meat packing (*Bur. of the Census [U. S.], Manfrs. 1905, pt. 3, pp. 457-491*).—Noted from another source (*E. S. R., 20, p. 63*).

The examination of sausage, E. ROTI (*Schweiz. Wehnschr. Chem. u. Pharm., 47 (1909), No. 7, pp. 93-96*).—Analytical data are reported and discussed. The

author concludes that on the fat-free basis sausage should not contain more than 75 per cent water.

Spectroscopic properties of yolk of egg, L. LEWIN, A. MIETHE and E. STENGER (*Arch. Physiol. [Pflüger]*, 124 (1908), pp. 585-590; *abs. in Jour. Chem. Soc. [London]*, 94 (1908), No. 554, II, 1054).—Attempts are being made to establish relationships between the coloring matters of egg yolk and blood on account of the close morphological relation of these materials. Spectroscopic analysis showed that the yellow coloring matter in the yolk gave characteristic bands and it is therefore concluded that it is possible to detect the adulteration of egg yolk by spectroscopic measurements.

The nutritive value and digestibility of raw and soft boiled hens' eggs, S. AUFRECHT and F. SIMON (*Deut. Med. Wchnschr.*, 34 (1908), No. 53, pp. 2308-2310).—From the results of a single digestion experiment with a healthy man, in which raw and soft boiled eggs were eaten in comparison with meat as a part of a simple mixed diet, the authors conclude that the raw eggs have the higher digestibility and nutritive value.

Desiccated milk, W. M. BOOTH (*Spice Mill*, 31 (1908), No. 10, pp. 620-623).—A brief description is given of the method of manufacture of several sorts of commercial powdered milk goods and analytical data are summarized regarding the composition of such materials. As the author points out, powdered milks are made to contain varying amounts of fat by the removal of more or less cream before evaporation.

Notes on investigations on the nutritive value of plant amids, E. SCHULZE (*Ztschr. Physiol. Chem.*, 57 (1908), No. 1-2, pp. 67-73).—A critical discussion of recently published work on this subject.

Starch, R. H. MERRIAM (*Bur. of the Census [U. S.] Manfrs. 1905, pt. 3, pp. 381-388*).—Noted from another source (*E. S. R.*, 20, p. 64).

On some vegetable fats native to Sarawak, J. HEWITT (*Agr. Bul. Straits and Fed. Malay States*, 6 (1908), No. 5, pp. 173-175).—A number of oil bearing seeds are described which are important sources of culinary fats used by Malays. Some information is also given regarding the character of the oils and methods of preparation.

Befri seed, W. H. MICHAEL (*Mo. Cons. and Trade Rpts. [U. S.]*, 1908, No. 338, p. 125).—Some information is given regarding the composition and use as food in India of the seed of a leguminous plant called befri (*Indigofera glandulosa*).

Sensitiveness to light of white animals fed buckwheat, W. ÖHMKE (*Zentbl. Physiol.*, 22 (1908), No. 22, pp. 685, 686).—It has been observed that white or partially white animals fed buckwheat, when exposed to light, suffer from skin disease, and the author made experiments with small animals to obtain additional data on this subject. It was found that the skin affection followed eating either buckwheat grain or hull, but that the effects were not noted if the animals were kept in the dark. The alcoholic extract of buckwheat produced the same effects while the extracted grain did not do so. The alcoholic extract was fluorescent and the author suggests a possible connection between buckwheat disease, fagopyrismus, and this property, in line with results of other investigators. [This work is of interest in view of the widespread belief that eating buckwheat causes rash and other skin troubles.]

Pellagra, a précis, C. H. LAVINDER (*Washington: Pub. Health and Mar. Hosp. Serv. U. S.*, 1908, pp. 22, pl. 1).—This digest of data regarding the occurrence, symptoms, and treatment of pellagra, a disease most prevalent in northern and central Italy and in Roumania and commonly attributed to eating spoiled Indian corn, is of interest in connection with the preparation and use

of corn as food, especially since "there has appeared in the Southern States a disease which is possibly true pellagra. . . .

"The culture of maize in the United States has been practiced since before the discovery of America, and it has always been a staple article of diet over a large area of territory, yet, with the exception of a few sporadic cases in Mexico and Central America, the North American continent has been singularly free from the disease. This has been attributed by writers on pellagra to a climate well adapted to growing maize, and probably to better general hygienic conditions among the poorer rural classes."

As regards the prophylaxis treatment of the disease, "this may be summed up briefly—cease using spoiled maize as food. This seems simple enough, but in reality is often difficult of accomplishment for many obvious reasons. In individual cases it may often be easy, but to apply it to a large area of territory is another matter. The only apparent methods would seem to be: (1) Avoid alterations in maize and consequent feeding on a toxic substance; (2) replace maize with some other cereal and cease using all food and drink derived from maize [where the disease exists].

"Many and various attempts have been made in Italy to do the former by the establishment of drying ovens, economical kitchens, pellagrous hospitals, etc., but such efforts have not met with great success. As for the latter, at present the difficulties seem almost insuperable."

**Corn oil in the treatment of pulmonary tuberculosis**, J. RITTER (*Jour. Amer. Med. Assoc.*, 51 (1908), No. 1, pp. 39, 40).—In this discussion of the use of corn oil in the treatment of tuberculosis the author presents data on its manufacture and general food value. In his opinion corn oil is an economical and useful food fat.

**Aboriginal methods of preparing corn for food by the American Indians of Arizona and New Mexico**, E. KRULISH (*Dietet. and Hyg. Gaz.*, 25 (1909), No. 1, pp. 55–57).—On the basis of personal knowledge the author discusses the methods followed in making corn bread and other corn food dishes and beverages.

**Some useful maize dishes** (*Natal Agr. Jour.*, 11 (1908), Nos. 10, pp. 1297–1303; 11, pp. 1446–1455).—A collection of recipes for Indian corn dishes.

**Rice, cleaning and polishing**, H. McK. FULGHAM (*Bur. of the Census [U. S.], Manfrs. 1905*, pt. 3, pp. 431–442).—Noted from another source (*E. S. R.*, 19, p. 166).

**Flour and grist mill products**, E. K. ELLSWORTH (*Bur. of the Census [U. S.], Manfrs. 1905*, pt. 3, pp. 341–379).—Noted from another source (*E. S. R.*, 20, p. 64).

**Milling of wheats**, J. C. BRUNNICH (*Ann. Rpt. Dept. Agr. and Stock [Queensland]*, 1907–8, pp. 67, 72–77).—As part of the work of the agricultural chemist milling tests of a large number of varieties of wheat were made and reported. The author notes that in the case of some of the flours gluten could not be obtained in the usual manner, by washing, as it crumbled into small pieces. This the author attributes to previous treatment of the flour with sulphur fumes.

**Hungarian wheat and Hungarian flour**, T. KOSUTÁNY (*Der Ungarische Weizen und das Ungarische Mehl. Budapest, 1907*, pp. 356, figs. 60, map 1).—An exhaustive summary and digest of data on Hungarian wheat and flour. The author subdivides his volume into three divisions, namely, (1) wheat from the standpoint of chemistry, plant physiology, physical and agricultural value, (2) flour, and (3) bread.

**The theory and practice of testing flour**, CORNELIA KENNEDY (*Pure Products*, 5 (1909), No. 3, pp. 127–135).—The author summarizes and describes the

methods of testing the quality of flour employed by millers, including determinations of moisture, ash, acids, total nitrogen and gliadin, baking tests, absorption and expansion tests, and determinations of wet and dry gluten.

"These are the principal tests, technical and chemical, generally used in testing flour. No single test has yet been found which can be used to the exclusion of other tests nor can any hard and fast rule be laid down as to what constitutes a flour of high baking qualities. By making these tests day in and day out records accumulate which are invaluable as guides in the testing and making of flour."

Defense of the bleaching of flour, B. S. ELLIOTT (*Amer. Hay, Flour, and Feed Jour.*, 14 (1909), No. 2, pp. 27-29).—A summary of data presented in a hearing before the Secretary of Agriculture, with reference to the legal status of flour bleaching.

Air bleaching of flour in the doughing state, C. CRISTADORO (*Amer. Miller*, 36 (1908), No. 8, pp. 619, 620).—According to the author, white bread can be made from yellowish durum flours by so controlling the fermentation of the dough that the bread is thoroughly aerated.

Fungus and bacterial growth on stored flour, H. G. BELL (*Amer. Miller*, 37 (1909), No. 4, pp. 280, 281, fig. 1).—As the author points out, the chief destructive agencies in stored flour are fungi and bacteria. "The fungi or molds readily break down the starches of the flour, setting free organic acids and causing the flour to go sour. The bacterial forms, on the other hand, are all liquefying, or decomposing, in nature, and cause the rapid destruction of the flour."

In a comparison of patent flour and baker's flour of good grades stored under the same conditions a greater number of both bacteria and molds were found in the baker's flour than in the patent grade. "This is probably due to the finer separations made in the process of separating the high-grade flour. Without doubt, these molds and bacteria have much to do with the deterioration of flours in storage. Probably the molds cause the rapid increase in acid, which reacts upon the gluten of the flour. Some of the liquefying bacteria probably react upon this same element, the gluten of the flour, causing the value of the material stored to deteriorate very rapidly."

As protection against the growth of these low forms of life the author suggests storage in well-lighted rooms.

The water content of bread, O. MEZGER (*Ztschr. Untersuch. Nahr. u. Genussmtl.*, 16 (1908), No. 7, pp. 395-397).—Determinations of the water content of black bread and white bread are reported which were undertaken in a comparison of actual conditions with the food-law requirements. The results show, according to the author, that in many cases the crumb of freshly baked bread does not show the qualities which might be expected from a determination of its water content.

Concerning the potato content of bread, J. TÓTH (*Chem. Ztg.*, 32 (1908), pp. 685, 686; *abs. in Chem. Abs.*, 2 (1908), No. 20, p. 2831).—No differences in protein content were noted in bread made from wheat, rye, a mixture of wheat and rye, and wheat and potato in equal parts. The potato bread, however, gave a smaller and moister loaf. The ash of the potato flour contained considerably less phosphoric acid than the wheat or rye flour.

Sophisticated zwieback, E. GLASER (*Ztschr. Untersuch. Nahr. u. Genussmtl.*, 16 (1908), No. 8, pp. 469-473).—One of the samples of zweiback described showed green patches due to the use of artificially colored caraway seeds and the other showed brown spots due to rancid oil from aniseed added to the dough. Suitable packages for marketing zweiback, and similar questions were discussed.

The iron and phosphorus content of vegetables, E. HAENSEL (*Biochem. Ztschr.*, 16 (1909), No. 1, pp. 9-19).—Determinations of total ash, phosphoric acid, and iron oxid in a large number of samples of vegetables, fruits, and nuts are reported. In 3 sorts of edible fungi, peanuts, and Brazil nuts lecithin was determined and in the case of the fungi the nitrogen also.

In connection with this work the author studied the amount of iron removed in cooking spinach and lettuce. In one test with spinach 0.17 per cent iron oxid was found in the material extracted in cooking and 0.73 per cent in the material not dissolved. In the second test the values were 0.15 and 0.66 per cent. When lettuce was cooked in a similar way 0.35 per cent iron was found in the extracted material and 0.84 per cent in the insoluble portion in one test and 0.39 and 0.85 per cent, respectively, in the second test. As the author notes, these results show that all the iron contained in such foods is not utilized if the water in which they are cooked is thrown away.

Beans containing hydrocyanic acid, L. GUIGNARD (*Rec. Actes Off. et Doc. Hyg. Pub., Trav. Cons. Sup. Hyg. Pub. France*, 36 (1906), pp. 594-632).—A summary of extended investigations of beans of different sorts.

The author concludes that all varieties of *Phaseolus lunatus*, both wild and cultivated, contain the hydrocyanic acid compound and the ferment which liberates the hydrocyanic acid when the grain, crushed or ground, is mixed with water and the temperature is not great enough to destroy the ferment. In order that beans may be free from hydrocyanic acid it is essential that cooking be long continued.

In an appendix a method of determining hydrocyanic acid is proposed.

Canned vegetables containing copper, G. GRAFF (*Ztschr. Untersuch. Nahr. u. Genussmtl.*, 16 (1908), No. 8, pp. 459-468).—The author concludes that copper salts are not native bodies and that their use should be restricted. The article contains data regarding the extent of the greening of vegetables with copper salts in Germany and methods for detecting copper.

The rapid change in composition of certain tropical fruits during ripening, H. C. PRINSEN GEERLIGS (*K. Akad. Wetensch. Amsterdam Proc. Sect. Sci.*, 11 (1908), pp. 74-84; *abs. in Jour. Chem. Soc. [London]*, 94 (1908), No. 553, II, p. 977).—Mangoes, bananas, tamarinds, and sapodillas, the fruits included in this investigation, are commonly gathered in an immature state; within a few days they become tender and palatable, and in a few days more they become overripe, soft, and unpalatable. Experiments with bananas showed that during the ripening process there is an evolution of carbon dioxid and water, and a considerable conversion of starch into sugar. Oxygen is necessary for the ripening process, and bananas will keep their starch intact if surrounded with an atmosphere of nitrogen. The author therefore considers that sugar production is a vital process, although he succeeded in showing the presence of an enzym capable of decomposing starch.

The results obtained with the mango were similar to those obtained with the banana. In the case of the sapodilla, however, the amount of sugar before and after ripening remains unaltered, and the change appears to be chiefly a softening of the hard pectin, and a deposition of tannin and gutta-percha from the juice as insoluble substances.

A sweetmeat from bananas, R. J. TOTTEN (*Mo. Cons. and Trade Rpts. [U. S.]*, 1909, No. 341, p. 76).—The author describes a method of making a crystallized fruit sweetmeat by drying bananas in sugar.

Sulphured fruit, H. LÉURIC (*Pharm. Zentralhalle*, 49 (1908), No. 42, pp. 251-254). The author examined different portions of packages of sulphured fruits to determine whether the sulphur content was uniform, a matter of importance in the examination of such goods in connection with food inspection.

According to his results the middle portion contained more sulphur than either the upper or lower layer. It was also found that the length of time the goods were kept affected the quantity of the sulphur, much smaller amounts being found after storage for about 9 months.

[Wholesomeness of sulphured fruits], A. J. ATKINS (*Cal. Fruit Grower*, 39 (1909), No. 1073, pp. 3, 11, fig. 1).—A popular description of a test in which a considerable quantity of sulphured fruit was included in the diet. From general considerations of weight and opinions of the subjects the author believes no harmful results were induced. Some determinations of the sulphurous acid in the cooked fruit are reported.

Vegetables and fruit as articles of diet and remedial agents, A. BRASS (*Schr. Volksw. Ver. Obst u. Gemüseverwert. Deut.*, 1908, No. 3, pp. 14).—A popular discussion of the subject.

Viscosity of cane-sugar molasses, H. C. PRINSEN GEERLIGS (*Internat. Sugar Jour.*, 10 (1908), No. 120, pp. 584-592).—The investigations reported and discussed led to the conclusion that concentration and temperature are the principal factors which determine the viscosity of molasses, and that the gum content, the presence of decomposition products of reducing sugar and other deposits, and the presence of fine grains of sugar, are secondary factors. Molasses which is satisfactory from the standpoint of viscosity may be obtained "by taking care not to drive the concentration of the last massecuites too far, or, in case they have become too much concentrated, to dilute them with dilute molasses in a judicious manner and this until the sugar-salt combination . . . has attained its own full-water content."

Maple sirup, A. THURSTON (*Merck's Rpt.*, 18 (1909), No. 3, pp. 60, 61).—The author reports results obtained in the examination of 33 samples of pure maple sirup and 3 samples of adulterated goods and outlines the methods followed.

The honey produced by sugar-fed bees, NEUBAUER (*Rheinische Bienenztg.*, 59 (1908), pp. 110-113; *abs. in Ztschr. Untersuch. Nahr. u. Genussmtl.*, 17 (1909), No. 1, p. 58).—The author does not consider that such goods can properly be called honey.

Concerning rose apple jam, O. MEZGER and K. FUCHS (*Ztschr. Untersuch. Nahr. u. Genussmtl.*, 16 (1908), No. 7, pp. 390-395, figs. 4).—A microscopical and chemical study of rose hips and jam made from them. This material is commonly homemade but has some commercial importance in Germany.

Ice cream, A. MCGILL (*Lab. Inland Rev. Dept. Canada Bul.* 162, pp. 14).—Of 80 samples of ice cream received in such condition that the fat content could be studied one-half contained over 14 per cent and one-half less than 14 per cent of this constituent. Of the last-mentioned group 12 samples contained less than 10 per cent fat. Gelatin was found in 73 of the samples examined and starch in 27. In some cases the starch was present in small quantities and "may be due to the freezing apparatus, or other container, having previously been used for a starch containing product."

Most of the samples were uncolored. Of those which were colored only two contained coal-tar dyes.

Composition of oriental foodstuffs: Bosa, halva, and locoum, N. PETKOFF (*Ztschr. Öffentl. Chem.*, 14 (1908), No. 11, pp. 205-208).—The first of these products is a nonalcoholic beverage and the remaining two a sort of confection. Analyses of a number of samples of each are reported.

Cider, A. MCGILL (*Lab. Inland Rev. Dept. Canada Bul.* 169, pp. 19).—The results of an examination of a large number of samples of cider are reported. Although the author considers some of them suspicious, he believes that more work is needed before a definite pronouncement can be made as to the specific character of cider and the extent of its variations.

Native wines, A. MCGILL (*Lab. Inland Rev. Dept. Canada Bul. 160*, pp. 23).—Analyses of a large number of samples of native wines are reported and discussed.

Swiss wine statistics (*Landw. Jahrb. Schweiz*, 22 (1908), No. 11, pp. 601–623).—A summary of statistics of the wine produced in Switzerland in 1907.

A study of certain genuine wines from the province of Florence, R. SALVADORI and A. MAZZARON (*Gaz. Chim. Ital.*, 38 (1908), I, pp. 54–63, figs. 2).—Analyses of 15 samples of red wine and 3 samples of white wine are included in this report.

Composition of Mâconnais-Beaujolais wine, G. PATUREL (*Prog. Agr. et Vit. (Ed. l'Est-Centre)*, 30 (1909), No. 5, pp. 147–153).—Samples of 49 wines were analyzed.

Analyses of musts and wines from vines sprayed with arsenic compounds, A. SZAMEITAT (*Ber. K. Lehranst. Wein, Obst u. Gartenbau Geisenheim*, 1907, pp. 176–179).—The analyses in most cases showed only a slight trace of arsenic.

The occurrence of arsenic in German wines, A. SZAMEITAT (*Ber. K. Lehranst. Wein, Obst u. Gartenbau Geisenheim*, 1907, pp. 180–185).—Of 38 samples analyzed 24 showed small amounts of arsenic, the source of which was not identified.

Investigation of musts and wines from vines infested with *Peronospora* (*Ber. K. Lehranst. Wein, Obst u. Gartenbau Geisenheim*, 1907, pp. 191–204).—The fermentation of the musts and composition of the wine were found to be entirely normal, and the conclusion is reached that the so-called peronospora taste noticeable in some wines must be due to faulty fermentation, incorrect cellar treatment, or some other similar cause.

Olive oil for protecting wine, U. ROSSI-FERRINI (*Rivista*, 4. ser., 14 (1908), No. 17, pp. 392–395).—Spoiling of wine owing to the rancidity of olive oil floated on top to protect it is discussed.

Effects of coffee and objections to the use of chicory, R. GRIMSHAW (*Brit. Food Jour.*, 11 (1909), No. 121, p. 3).—Data on the effects of coffee and chicory are summarized from which the following statements are quoted:

“The organic constituents of roasted chicory mainly consist of sugar, with caramel, inulin, and albumin. With the caramel there are also other organic coloring matters; and the tinctorial power being very great, this is a principal reason for the employment of chicory as an addition to coffee, very slight quantities thereof sufficing to make true coffee infusion appear very dark brown, hence apparently very strong. Digestion is more impeded by chicory than by coffee. The constant use of extract of chicory as a drink may cause injury to the system by reason of the great quantity of potash salts which it contains, and it exhibits no compensating advantages in the way of nourishment or stimulating and exhilarating effects on the system.”

Concerning the quality of tea, C. HARTWICH and P. A. DU PASQUIER (*Apoth. Ztg.*, 24 (1909), No. 14, pp. 130, 131).—A number of analyses are reported and discussed with reference to judging the quality of tea.

Concerning coco, K. FARNSTEINER (*Ztschr. Untersuch. Nahr. u. Genussmit.*, 16 (1908), No. 11, pp. 625–647).—A study of the effects of the different methods of treating coco to increase its solubility.

The microscopical examination of chocolate and powdered coco, E. COLLIN (*Ann. Chim. Analyt.*, 13 (1908), No. 12, pp. 471–478, fig. 1).—With a view to facilitating the examination of coco and chocolate the author reports the results of a microscopical study of the histological elements of these materials.

Pepper adulterated with vetch seeds, FLEURY (*Trar. Sci. Univ. Rennes*, 6 (1907), pp. 149–143).—A sample of unground black pepper examined was

found to contain 30 per cent of vetch seed treated with some solution which had given a spicy taste and caused a wrinkled appearance.

Ground pepper, A. MCGILL (*Lab. Inland Rev. Dept. Canada Bul.* 165, pp. 33).—Of the 298 samples of pepper examined 216 were considered genuine, 13 doubtful, and 69 adulterated.

"It appears that the chief centers of adulteration of pepper are in and about Montreal, although Winnipeg is becoming too prominent in this regard."

Oil of lemon, A. MCGILL (*Lab. Inland Rev. Dept. Canada Bul.* 154, pp. 11).—Analyses are reported of 45 samples of lemon oil collected in Canada. Definite conclusions are not drawn from the work.

Concerning canarium oil, K. WEDEMEYER (*Seifensieder Ztg.*, 34 (1907), p. 26; *abs. in Ztschr. Untersuch. Nahr. u. Genussmtl.*, 17 (1909), No. 1, pp. 57, 58).—A study of the physical and chemical characteristics of canarium or Java almond oil. This oil, as stated, is used as a high grade culinary fat and also as an adulterant for almond oil. When thus used it may be detected by means of its iodine number.

Concerning Liebig's meat extract, R. ENGELAND (*Ztschr. Untersuch. Nahr. u. Genussmtl.*, 16 (1908), No. 11, pp. 658-664).—The investigations reported were undertaken with a view to simplifying the technique of investigations reported earlier (*E. S. R.*, 18, p. 563).

Are yeast extracts justifiable as substitutes for extract of meat? A. GAMGEE (*Brit. Med. Jour.*, 1908, No. 2486, pp. 449-453).—From a digest of data on the subject the author concludes that yeast extracts should not thus be used. The dietetic value of such materials is also considered.

Purin metabolism and yeast extracts (*Brit. Med. Jour.*, 1908, No. 2486, pp. 518-520).—An editorial discussion of the question considered in the above article.

Food extracts made from yeast, A. C. CHAPMAN (*Brit. Med. Jour.*, 1908, No. 2502, pp. 1741-1743).—The author does not agree with the conclusions advanced by Gamgee, as noted above.

Diastase ferments, W. A. PUCKNER (*Jour. Amer. Med. Assoc.*, 51 (1908), No. 2, pp. 140-142).—Results are reported which were obtained in the examination of the diastatic power of a number of samples of commercial diastase and recommendations made for the testing of such goods.

The factors and cost of board on Minnesota farms, T. P. COOPER (*Jour. Home Econ.*, 1 (1909), No. 1, pp. 43-51).—Data regarding the cost of board on farms in selected regions in Minnesota are summarized and the factors which influence the cost of board are discussed. On an average the cost of farm board per man for the years 1905, 1906, and 1907 was \$12.07 per month or 40 cts. per day. The average annual consumption of farm produce per man on a number of Minnesota farms was calculated.

[Standards of living of Mexican labor in the United States], V. S. CLARK (*Bur. Labor [U. S.] Bul.* 78, pp. 466-522).—This forms a part of an extended discussion of the general subject of Mexican labor in the United States and previously noted (*E. S. R.*, 20, p. 991). Information regarding home life and standards of living is given, as well as general information regarding food and diet. According to the author, it is the general opinion that the Mexican immigrants have a better and more varied diet in the United States than at home.

French school cantines, L. GOLDSCHMIDT (*Daily Cons. and Trade Rpts. [U. S.]*, 1909, No. 3384, p. 13).—A brief note on the dinners served to school children at Nantes, France.

The diet of the Chinese, MATIGNON (*Rev. Hyg. et Pol. Sanit.*, 31 (1909), No. 2, pp. 120-125).—The food habits of the Chinese in North China are discussed, animal and vegetable foods described, and general data summarized.

**Prices and wages in India** (*Calcutta, India: Govt., 1908, pp. 226*).—A collection of statistics of wages and wholesale and retail prices of foodstuffs in India for periods of years up to 1907 or 1908.

**Manual for the subsistence department, United States Army** (*War Dept. [U. S.], Off. Com. Gen. Doc. 321, pp. 142, fig. 1*).—Subsistence stores, ration issues, subsistence property including kitchen cars, and other related subjects, are considered in this manual revised to September 1, 1908, and prepared under the direction of the Commissary-General of the U. S. Army.

**U. S. Navy cookbook** (*Annapolis, Md., 1908, pp. 62*).—Recipes and directions are given for the preparation of a large number of food materials in quantities sufficient for a mess of 100 men. The cookbook was prepared by the direction of the Bureau of Navigation at the School for Cooks and Bakers at the U. S. Naval Training Station, Newport, R. I.

**The baking trade**, G. WOLF (*Bäckerei. Hanover, 1907, pp. 147, figs. 71*).—A handbook designed for the instruction of bakers and students of milling and also for self-instruction. The three sections into which the book is divided include raw materials, bread, and bakery equipment, machines and ovens.

**Plain cookery**, CATHARINE A. MULLIGAN (*Winthrop Norm. and Indus. Col. S. C. Bul., 1 (1907), No. 1, pp. 54, figs. 7*).—Detailed directions are given for the preparation of vegetables, eggs, meats, poultry, and other foods, and some general principles of cookery are discussed.

**Large meals for little money**, FLORENCE K. JOHNSON (*New York, 1909, pp. 36*).—This pamphlet is designed for use in university extension work, and in a series of twelve lessons gives directions for cooking simple dishes. Bills of fare for inexpensive meals and similar data are also included.

**Treatise on food and nutrition under normal and pathological conditions**, II, E. MAUREL (*Traité de l'Alimentation et de la Nutrition à l'État Normal et Pathologique. Paris, 1908, pp. 680; rev. in Rev. Gén. Sci., 19 (1908), No. 14, p. 589*).—In this volume the author considers especially the rations suitable for growth, maintenance of the adult, food requirements in old age, and similar topics.

**A system of diet and dietetics**, G. A. SUTHERLAND (*London, 1908, pp. 906; rev. in Brit. Med. Jour., 1909, No. 2513, Epit., pp. 537-539*).—This volume contains articles by different authors on a variety of topics concerned with diet in health and disease. Among others are a paper on the Evolution of Diet by H. Campbell, on the Physiology of Digestion by E. I. Spriggs, on Diet in Old Age by H. Campbell, and on Diet in Hot Climates by Sir P. Manson.

**Criteria and standards in infant feeding**, T. G. ALLEN (*Jour. Amer. Med. Assoc., 51 (1908), No. 20, pp. 1687-1691*).—The author discusses infant feeding in relation to protein and energy quotients and suggests that these values be used as a basis for determining infant diet.

**Chemistry in its relation to food**, J. F. SNELL (*Jour. Soc. Chem. Indus., 28 (1909), No. 2, pp. 49-53, dgms. 2*).—The principal subjects included in this discussion are the determination of the relative value of foods, the elucidation of processes of digestion, the hygienic preservation of food, and the detection of adulterants.

**The influence of feeding on the chemical composition of the animal body**, L. B. MENDEL (*Biochem. Ztschr., 11 (1908), No. 4, pp. 281-293*).—A summary of investigations carried on under the author's direction which have been previously published in full (*E. S. R., 20, pp. 265, 266, 267*).

**The resorption of protein**, K. von KÖRÖSY (*Ztschr. Physiol. Chem., 57, (1908), No. 3-4, pp. 267-287*).—The author's investigations, in his opinion, strongly substantiate the theory that resorbed protein becomes a part of the proteid material of the blood.

Further experiments on the utilization in the animal body of protein cleavage products, E. ABDERHALDEN and J. OLINGER (*Ztschr. Physiol. Chem.*, 57 (1908), No. 1-2, pp. 74-79).—Meat protein cleavage products gave satisfactory results in feeding experiments with a dog. Casein cleavage products were not so satisfactory.

The behavior of carnitin in animal metabolism, R. ENGELAND (*Ztschr. Untersuch. Nahr. u. Genussmtl.*, 16 (1908), No. 11, pp. 664-666).—In experiments with dogs it was found that carnitin was completely broken down in the body. Some of the data reported indicate that carnitin may not be entirely harmless. Experiments with *Herbivora* (a rabbit) did not lead to conclusive results.

The digestibility of fat in the animal body, III, S. LEVITES (*Ztschr. Physiol. Chem.*, 57 (1908), No. 1-2, pp. 46-48).—A note on the determination of glycerin in feces in connection with the author's work on the digestion of fat (*E. S. R.*, 20, p. 663).

The functions of the liver in relation to the metabolism of fats, J. B. LEATHES (*Lancet [London]*, 1909, I, No. 9, pp. 593-599).—Results of the author's investigations and the work of other observers are summarized and discussed in this theoretical consideration of the metabolism of fat.

The author believes that "it is a fair hypothesis to make the starting point for work that the liver stands in a different relation to circulating fat [i. e., fat absorbed from the intestine and consigned into the systemic circulation] from the other organs of the body. Its work is to take up this fat and bring about certain changes in it [designated desaturation of the acids], the result of which is to make this material available for the use of the organs in which its potential energy is required." Reasons are given for the belief that the change referred to is at any rate in part a desaturation of the fatty acids.

"There is another difference between what may be called organized fat—the fat, that is, in the cells of the heart, muscles, kidneys, etc.—and the unorganized merely stored fat of the adipose tissue. The latter is the unaltered fat of the individual's food; it has its iodine value determined by that of the fat which has been absorbed, but it also contains no phosphorus. The fat in the liver and the other organs of the body, the organized fat, is very largely composed of phosphatid lipid substances. Of these we know more or less dimly of a considerable number, more or less definitely, of one lecithin. . . . It has also been repeatedly noted that the fatty acids which can be obtained by saponification of lecithin or other phosphatid lipid substances are more unsaturated than those from adipose tissue.

"It may therefore be that the work of the liver consists in the conversion of food fat into organized fat and that the desaturation of fatty acids is a change which occurs after that conversion has taken place; a change that is, therefore, removed from our ken so long as our knowledge of the nature and constitution of these lipid molecules is as meagre as it is at present."

The probable importance of octahydroxy-arachidic acid in the metabolism of fat is discussed.

A preliminary note on the examination of fat in the liver in health and disease, E. L. KENNAWAY and J. B. LEATHES (*Lancet [London]*, 1909, I, No. 2, pp. 95-98).—Pig, goat, dog, and human liver were included in this study of liver fat.

Animal fat and the petroleum ether extract of the liver, Y. NUKADA (*Bi-chem. Ztschr.*, 14 (1908), No. 5-6, pp. 419-429).—According to the author about 0.4 to 0.7 per cent of the fat of flesh consists of a mixture of the lower water soluble and volatile fatty acids. The amount increases with the length of time the fat is kept. Such fat when fresh contains only small amounts of material

with free hydroxyl groups. On storage the amount of such material increases. On saponification, such fat and liver extract both yield cholesterolin, the yield from liver fat being considerably the greater.

The behavior of certain indigestible carbohydrates in the digestive tract, L. B. MENDEL (*Zentbl. Gesam. Physiol. u. Path. Stoffwechsels, n. ser.*, 3 (1908), No. 17, pp. 641-654).—A digest of data on insoluble carbohydrates, particularly those of marine algæ, and a summary of digestion experiments carried on in the author's laboratory with such foods in comparison with raw Italian chest-nuts. See also a previous note (*E. S. R.*, 18, p. 1068).

The possible advantage of these algæ carbohydrates as laxatives and other questions are considered.

An improved respiration apparatus of the Regnault and Reiset type, N. ZUNTZ and C. OPPENHEIMER (*Biochem. Ztschr.*, 14 (1908), No. 5-6, pp. 361-368, pl. 1).—The respiration apparatus described is so arranged that it is immersed in water during experimental periods. The authors claim greater convenience of operation and the elimination of parts which are easily broken. With this form of apparatus it is not necessary to use mercury, and this also is considered an advantage.

Adjusting and testing the modified Regnault and Reiset respiration apparatus devised by Zuntz and Oppenheimer, A. SCHLOSSMANN and H. MURSCHHAUSER (*Biochem. Ztschr.*, 14 (1908), No. 5-6, pp. 369-384, figs. 3).—According to the results of check experiments in which alcohol was burned in the respiration chamber the instrument gives very accurate results. Similar accuracy was obtained in an experiment with a dog which is also recorded.

Respiratory exchange of an infant as shown by experiments with the Zuntz and Oppenheimer respiration apparatus, A. SCHLOSSMANN, C. OPPENHEIMER, and H. MURSCHHAUSER (*Biochem. Ztschr.*, 14 (1908), No. 5-6, pp. 385-406).—Using the respiration apparatus described above, experiments with a nursing infant are reported. Considering the average of six 8-hour periods, the oxygen consumption was 0.731 gm. per kilogram of body weight and the carbon dioxid production 0.913 gm., and the respiratory quotient 0.911. The average weight of the child was 5.79 kg. Determinations are also reported with infants asleep for different periods after feeding.

The transformation of energy in the muscles when work is performed, M. F. MAIGNON (*Ann. Soc. Agr. Sci. et. Indus. Lyon*, 1907, pp. 145-161).—A mathematical discussion of food energetics.

The effects of muscular work upon the excretion of endogenous purins, E. L. KENNAWAY (*Jour. Physiol.*, 38 (1908), No. 1, pp. 1-25).—Quotations from the author's summary of his extended investigations follow:

"During unaccustomed muscular exercise, the output of uric acid is diminished, while that of the purin bases is increased; the total output of purin compounds does not differ greatly from the normal amount. Such exercise is followed by a greatly increased excretion of uric acid.

"If a certain amount of a certain form of work be performed on a series of occasions, the changes observed show a progressive diminution in amount. . . .

"Salicylic acid and muscular work can produce their characteristic effects upon the output of uric acid simultaneously without any apparent modification, and the amount excreted under these conditions is extremely large. These facts are most readily explained by supposing that muscular work leads to an increased formation of uric acid.

"The increase of purin bases and decrease of uric acid in the urine during muscular work appear to be due to defective oxidation of purin compounds. It was not found possible to produce evidence of a definite increase in these oxidative processes by inhalation of oxygen.

"The total amount of purin compounds excreted is a more constant quantity, both from day to day and at periods separated by intervals of months, than is the output of uric acid.

"The output of purin bases exhibits variations, corresponding to different portions of the day, which are very similar to those exhibited by the uric acid output.

"The amount of uric acid excreted tends to vary inversely, and that of the purin bases to vary directly, with the volume of urine."

Principles of general metabolism of matter and energy. II, O. KRUM-MACHER (*Ergeb. Physiol.*, 7 (1908), pp. 444-446).—A critical summary and digest of data on the metabolism of matter and energy.

International catalogue of scientific literature. Q—Physiology (*Internat. Cat. Sci. Lit.*, 6 (1909), pt. 1, pp. VIII+832; 6 (1908), pt. 2, pp. 936).—The bibliography of physiology, including experimental psychology, pharmacology, and experimental pathology, previously noted (*E. S. R.*, 19, p. 463), is continued in this volume, which contains material received between May, 1906, and August, 1907. Part 1 is the author catalogue and part 2 the subject catalogue.

### ANIMAL PRODUCTION.

Reports to the evolution committee, W. BATESON ET AL. (*Rpts. to Evolution Com. Roy. Soc. [London]*, 1908, No. 4, pp. 60, figs. 3).—This report is in continuance of previous work on the physiology of heredity. Investigations on poultry and sweet peas are reported by W. Bateson and R. C. Punnett, and on stocks by Miss E. R. Saunders and H. B. Killby; a preliminary account of the inheritance of coat color in mice by Miss F. M. Durham; on sex inheritance in the moth *Abraxas grossulariata* and its variety, *A. grossulariata* var. *lacticolor* by L. Doncaster; a note on the inheritance of sex in canaries by Miss Durham and Miss D. C. E. Marryat; and a corrigenda to report 3 on the factors which produce hoariness.

The work reported on poultry deals chiefly with the factors which influence the inheritance of (a) comb structure, and (b) white plumage. The study of comb inheritance has involved over 12,500 birds, and the results of this and previous work are presented in tabular form. "The rose comb is in reality a single comb modified by the presence of a 'rose' factor. The omission of this factor enables the single comb to appear. The same considerations apply to the pea comb, which is single plus a pea factor. The true allelomorphic pair in each case is the presence of a given factor which is dominant to the absence of that factor. . . . As the acceptance of the 'presence and absence' hypothesis seems to demand some general expression for such interrelation between factors belonging to distinct allelomorphic pairs, we propose the terms 'epistatic' and 'hypostatic.' For example, the combless, the single-combed, and the rose-combed conditions may, in the light of our present knowledge, be regarded as forming a cumulative series and we should speak of the factor for single as being dominant to the combless condition but hypostatic to the rose factor, and similarly the rose factor may be referred to as epistatic to the single."

A walnut comb is one in which both the rose factor and the pea factor are present, and such a comb may be either homozygous or heterozygous for one or both of these factors.

In the studies of white plumage there are two distinct classes of white fowl: (a) Those in which white is dominant to color, and (b) those in which white is recessive to color. The recessive whites are of at least three kinds, namely, the white birds which have arisen in the course of these experiments, the white of the silky fowl, and the white of the rose-comb bantams.

The results of the experiments in sex inheritance with canaries and the moth *A. grossulariata* are closely parallel, the females considered to be heterozygous in sex, femaleness being deemed dominant, and the male as homozygous in the absence of femaleness. The black-eye character of canaries is a dominant and the pink-eye character a recessive. "Whatever may be the truth regarding the transmission of sex, there is no escape from the remarkable conclusion that just as the normal females of the moth *A. grossulariata* are in reality hybrids in the laticolor character, so the ordinary black-eyed hen canaries are hybrids in the pink-eye character."

**The heredity of sex**, R. C. PUNNETT and W. BATESON (*Science, n. ser.*, 27 (1908), No. 698, pp. 785-787).—In this article Mendelian theories of sex are discussed. The authors believe that the sex determinants behave as Mendelian allelomorphs, females being dominant, that female individuals are heterozygous in respect to sex and males homozygous, and that at least in some cases when two dominant factors coexist there is a repulsion between them such that each gamete takes one or other of these two factors, not both.

**Secondary sexual characters**, R. MÜLLER (*Das Problem der Sekundären Geschlechtsmerkmale und die Tierzucht. Stuttgart, 1908, pp. 89*).—This is an expansion of two lectures, in which the differences between the sexes in animals are discussed.

**Recessive characters**, C. B. DAVENPORT (*Science, n. ser.*, 28 (1908), No. 725, p. 729).—A cow without a trace of body hairs gave birth to a calf with the ordinary hairy coat. "This result indicates that the presence of the hairy follicles is dominant over their absence. This adds another case to the law that the presence of a quality is dominant over its absence or that a retrogressive or retarded condition is recessive to the more developed conditions."

**Degeneration, albinism, and inbreeding**, C. B. DAVENPORT (*Science, n. ser.*, 28 (1908), No. 718, pp. 454, 455).—The author enunciates certain principles which aid in understanding the reason for the degeneration which sometimes follows the practice of inbreeding. "When the two parents have any organ or quality A in two conditions, A+ and A—, of which the former is a highly developed or progressive condition, the latter a poorly developed or even absent condition, the former condition will regularly dominate over the latter. . . . When both parents have an organ in a low condition of development it will be so also in all of their children. This principle explains the persisting or increasing degeneration in the descendants of two degenerate parents."

Another class of degeneration is albinism, which is not a sport but a necessary, predictable result of certain combinations of gametes. "The only part that inbreeding plays is to make more probable the necessary combination of gametes. The degeneration in this case follows from the union of two negative factors in dihybrids, and this is a common cause of degeneration."

**Breeding experiments with rats**, T. H. MORGAN (*Amer. Nat.*, 43 (1909), No. 507, pp. 182-185).—This is a report of some experiments in crossing rats to determine how far the Mendelian lines of discontinuous inheritance apply to wild varieties and species. In crosses of the black rat with the gray roof rat black is dominant to gray, whichever way the cross is made. All attempts thus far to cross the black rat or the roof rat with the Norway rat have failed.

**The chondriosomes as bearers of the hereditary qualities**, F. MEYER (*Arch. Mikros. Anat. u. Entwicklungsgeschichte*, 72 (1908), No. 4, pp. 816-867, pls. 4; *abst. in Amer. Nat.*, 43 (1909), No. 507, pp. 190-192).—The author finds a large number of independent structures in the cytoplasm of the chick embryo at about the third day of incubation, which he calls "chondriosomes." He thinks that

these are the bearers of the hereditary qualities of the cytoplasm as chromosomes are the bearers of the hereditary qualities of the nucleus.

The inheritance of hyperdactylism in poultry, D. BARFURTH (*Arch. Entwickl. Mech. Organ.*, 26 (1908), No. 4, pp. 631-649).—Seven hyperdactyl Orpington hens were mated to a normal male of the same breed. Of 152 chickens which resulted 80, or 52.6 per cent, had the normal number of toes. Instances of hyperdactylism noted by other observers are cited.

Spurious allelomorphism [in poultry], W. J. SPILLMAN (*Amer. Nat.*, 42 (1908), No. 501, pp. 610-615).—Black Langshan males were mated with Barred Plymouth Rock females. In the progeny, all the females were black and all the males barred. The author also calls attention to several cases reported by other observers.

Yearbook of scientific and practical animal breeding, R. MÜLLER (*Jahrb. Wiss. u. Prakt. Tierzucht*, 3 (1908), pp. LLIV+227).—The larger part of this report is occupied with critical reviews of literature relating to the anatomy, physiology, psychology, biology, geographical distribution, hygiene, feeding, breeding, and the history of domesticated breeds. There are original articles on the acclimatization of domesticated animals, a mutation in the Fjell breed of cattle, the "polled" character of cattle, and the influences that affect the length of the pregnant period of domesticated animals. From data collected on the last-named subject, P. Sabatini concludes that in horses, cattle, and sheep the length of pregnancy is shorter with twins, with the first born, with a female fetus, and in the early maturing breeds than with single births, males, the second or later births, or in the late-maturing breeds. These results do not appear to hold true in the case of swine.

The principles of animal nutrition, H. P. ARMSBY (*New York*, 1908, 3. ed. rev., pp. VII+614).—This is the third revised edition of this work (E. S. R., 14, p. 896).

The rate of growth of the egg yolk in the chick, and the significance of white and yellow yolk in the ova of vertebrates, O. RIDDLE (*Science*, n. ser., 27 (1908), No. 703, p. 945).—The author has employed a method discovered by Daddi in 1896, by which the rate of growth of the egg yolk of the chick may be easily measured. "If the fat stain Sudan III be fed to laying hens at intervals of one, two, or more days, the stain can be found later in the form of concentric red rings in all of the rapidly growing ova. The actual rate of growth varies widely from 0 to 2 mm., but one day of growth normally includes a layer of white yolk and a layer of yellow yolk. It is probable that the layer of white yolk represents the part which is grown during the later hours of the night, and that the yellow yolk is yolk of more rapid growth produced during the remainder of the day."

Sudan III deposited on the egg and transmitted to the chick, S. H. and SUSANNA P. GAGE (*Science*, n. ser., 28 (1908), No. 719, pp. 494, 495).—The authors repeated the experiments of Riddle (noted above) and summarize the work on the subject as follows:

"The specific fat stain, Sudan III, colors the fat laid down in the living hen and in the fatty portions of the yolk while the feeding experiments are in progress, and thus serves to give exact data concerning the time and amount of deposit.

"The eggs so colored hatch, and the chick utilizing the yolk as food produces fat in its own body colored as in the adult, showing in the most striking manner the transmission of a specific and unusual or foreign substance from the mother to the egg, and from the egg to the offspring, and thereby marking the transmission of the actual substance of the egg, and indirectly of the mother, to the offspring.

"The precision of the method and its striking results apparently open to biologists a field which has lain dormant since its discovery by Daddi 12 years ago, that is, the possibility of following with great exactness at least one of the processes of nutrition."

Comparative investigations on the effect of proteid and nonproteid nitrogen on (the) gain in weight of ruminants, J. JUST (*Landw. Vers. Stat.*, 69 (1908), No. 5-6, pp. 393-460).—For these experiments 7 months old lambs were fed a basal ration low in protein, which consisted of meadow hay, starch meal, and sugar. For supplementary rations gluten meal was alternated with molasses chips, malt sprout extract, potato chips, and grass extract.

There was but little difference between the protein digestion coefficient of the supplementary feeds, except that with potato flakes it was somewhat lower and with grass extract it was considerably lower than with the other feeds. In general the results of these experiments agreed with those of Friedlaender (*E. S. R.*, 20, p. 70) that amids are not of equal value with true protein.

On the influence of food fat on the body fat of swine, with special reference to the final location of phytosterin, J. KÖNIG and J. SCHLÜCKEBIER (*Ztschr. Untersuch. Nahr. u. Genussmtl.*, 15 (1908), No. 11, pp. 641-661; *abs. in Chem. Zentbl.*, 1908, II, No. 5, p. 427).—From their original investigations the authors found that fat in cotton-seed meal and sesame meal was well utilized by young animals. The nonsaponifiable fats may be resorbed as body fats. Coloring matters in cotton-seed meal and sesame meal may be detected in the body fat of swine, though when fed to cows they could not be detected in milk fat. The body fats seem to retain the same chemical and physical properties that they have in the feed. As animals grow older the melting point of the body fat is raised and the corresponding iodine number falls. Leaf fat has a high melting point and a low iodine number. Phytosterin and cholesterol appear partially as koprosterin in the feces, though a part is unchanged. Relatively more nonsaponifiable fat is found in the feces than is contained in the food fat. After a long feeding with plant fats only cholesterol appears in the body in organic fats. Organs like the brain and liver though rich in cholesterol are not rich in phytosterin.

These experiments confirm the results of other investigators (*E. S. R.*, 16, p. 18) that the phytosterin and phytosterin-acetate test of Bömer is a reliable method of detecting plant fats in animal fats.

Daily rations approximately balanced for different animals per 1,000 lbs. live weight, W. H. DALRYMPLE (*Ann. Rpt. Agr. and Indus. Statis. Bd. Agr. and Immigr. [La.]*, 1908, pp. 5-8).—This presents sample rations for horses, mules, oxen, and dairy cattle, in which cotton-seed meal, molasses, and other by-products can be utilized.

Commercial feeding stuffs of Pennsylvania in 1907, F. D. FULLER (*Penn. Dept. Agr. Bul.* 167, pp. 7-97).—This is the annual report of the chemical and microscopical work performed by the division of chemistry in the examination of commercial feeding stuffs, and contains descriptions, analyses, and the comparative cost of feeds.

"Of the 560 samples collected, 498 were examined chemically and microscopically. Fifty-eight samples contained less protein than guaranteed by the manufacturers, and 37 samples were deficient in fat. . . . Practically all of the molasses feeds found upon the market contained a large proportion of weed seeds, and many of them were adulterated with rice hulls. Money which was formerly spent in purchasing low grade oat feeds is apparently being put into feeding stuffs of standard quality, and, therefore, we do not find as much oat feed in Pennsylvania as in former years." The most serious adulteration was

the use of ground rice hulls, which are useless as a feed, to adulterate molasses grains and other dairy feeds. "The poor quality of cotton-seed meal was due largely to weather conditions through the growing season, making it more difficult for mills to separate the hulls from the seed."

Analyses were also made of linseed meal, distillers' grains, brewers' grains, malt sprouts, gluten feed, wheat flour, bran and middlings, mixed feeds, animal by-products, and proprietary feeds of various kinds.

The artificial drying of moist feeding stuffs and their agricultural significance, D. MEYER (*Die Künstliche Trocknung der Wasserreichen Futtermittel*. Hanover, 1908, pp. VI+130, figs. 26, dgms. 2).—This work describes methods and apparatus used in drying beet chips, turnip tops, potatoes, brewers' grains, and distillers' slops. The nutritive value of these feeding stuffs for different kinds of live stock is also briefly treated in a popular manner.

Corn grits and corn meal as brewing adjuncts, J. L. WILLS (*Brewers' Jour.*, 33 (1908), No. 2, pp. 51-55, figs. 3).—The author discusses the adaptability of the corn kernel to replace rice as a starch adjunct. Only No. 2 white corn with degerminated kernel can be used for this purpose. The finished product consists of hard white, angular fragments known as corn grits, and approaches rice in composition.

The composition of brewers' and distillers' grains, T. W. FAGAN and C. ALLAN (*Edinb. and East of Scot. Col. Agr. Bul.* 16, pp. 21).—The percentage of fat and nitrogeneous matter was found to vary to only a slightly greater extent in distillers' grains than in brewers' grains. "As far as the chemical analyses of the two grains is concerned there does not seem to be the difference in composition that would be expected when the prices of the two feeding stuffs are taken into consideration."

The nutritive value of grape marc, J. FABRE (*Ann. École Nat. Agr. Montpellier, n. ser.*, 8 (1909), No. 3, pp. 219-228).—This is a report of analyses and of digestion coefficients of grape marc. The percentage of digestibility in horses was found to be as follows: Dry matter 28.5, protein 21.5, fat 50.4, nitrogen-free extract 34.5, fiber 20.3, and ash 29.0. In sheep the digestion coefficients were for dry matter 33.6, protein 15.9, fat 49.3, nitrogen-free extract 36.9, fiber 26.4, and ash 50.1 per cent.

The occurrence of cyanogenetic glucosids in feeding stuffs, T. A. HENRY and S. J. M. AULD (*Jour. Soc. Chem. Indus.*, 27 (1908), No. 9, pp. 428-433, dgm. 1).—It has been previously noted that a number of plants used for feeding stuffs contain cyanogenetic glucosids and a glucosidolytic enzym. When these two products are brought into contact by placing them in water hydrocyanic acid is produced as a result of the decomposition of the glucosid. The author describes a method for determining the hydrocyanic-acid content and discusses the possibility of poisoning stock by feeding plants in which hydrocyanic acid is liable to be produced. If the enzymes in the plant are destroyed by heating there is less danger of poisoning.

Farm stock, C. W. BURKETT (*New York*, 1909, pp. IX+358, pl. 1, figs. 113).—This is a practical treatise on horses, cattle, sheep, and swine, including their breeding, feeding, care, and management in health and disease. "It is an everyday handbook of live stock and contains the best ideas gathered from the various authorities and the experience of a score of practical men in all departments of live-stock production."

The meat industry in Hungary, L. M. DOUGLAS (*Meat Trades' Jour.*, 28 (1908), No. 1072, pp. 564, 565, figs. 3; *Vet. Jour.*, 64 (1908), No. 402, pp. 595-599, pls. 3).—The information contained in this brief popular account of animal production and dairying in Hungary was obtained from a personal visit.

Horse breeding is a great industry and over \$5,000,000 worth of horses are exported annually. Native Hungarian cattle constitute about 22 per cent of the total number of cattle, the rest being mainly breeds imported from Switzerland. Until recently but little attention had been paid to butter making, and hog fat is used largely to take the place of butter. The number of swine in the country is about 5,000,000. These for the most part consist of the Mangalica breed, a coarse, long-haired beast with about 5 in. of fat along the back. Recently Yorkshires have been introduced. The system of meat inspection is very complete and up-to-date abattoirs exist throughout the country.

**Cattle raising**, F. DETTWEILER (*Die Aufsucht des Rindes*. Berlin, 1908, pp. 235).—This is a treatise for the practical breeder. There are brief accounts of the origin of domesticated cattle and of the factors which influence inheritance. The main part of the book is devoted to the care and management of the growing animal. In an appendix of 61 pages data are given as to the cost of raising young stock of the different breeds.

**The history of cattle breeding at Einsiedeln**, P. O. RINGHOLZ (*Landw. Jahrb. Schweiz*, 22 (1908), No. 8, pp. 413–508, pls. 4, figs. 2).—A contribution to the history of the Brown Swiss cattle from the ninth century to the present time. It contains much general information on the agriculture of Switzerland of the period, as well as an account of the improvement and importance of the Brown Swiss breed.

**The spotted cattle of southern Moravia**, M. NITSCHIE (*Österr. Molk. Ztg.*, 16 (1909), Nos. 1, pp. 1–3; 2, pp. 17–19; 3, pp. 31–33; 4, pp. 45–47).—This is an abstract of a work by L. Adametz on the spotted cattle of this region. The variations in color, conformation, and economic qualities of these cattle are described. The methods of feeding are also noted.

**Aberdeen-Angus cattle**, A. PULLING (*London*, 1908, pp. 150).—This contains an account of the leading families of this breed, with a few notes as to why certain families have become fashionable.

**On the protein minimum for growing wethers**, T. KATAYAMA (*Landw. Vers. Stat.*, 69 (1908), No. 5–6, pp. 321–341).—From digestion experiments with 4-year-old wethers, the author concludes that leaving out of consideration the growth of wool, 0.41 kg. per 1,000 kg. live weight is the minimum protein requirement for wethers. The rations in these experiments consisted of hay, straw, sugar, starch, and aleuronat.

**Fertility in Scottish sheep**, F. H. A. MARSHALL (*Trans. Highland and Agr. Soc. Scot.*, 5. ser., 20 (1908), pp. 139–151).—From a study of data collected from the lambing returns of 1905, 1906, and 1907 it appears that some form of flushing or extra feeding immediately preceding the lambing period increases the percentage of fertility.

**Unique experiment in sheep breeding**, J. B. SPENCER (*Farmer's Advocate*, 43 (1908), No. 846, p. 1883).—Selection experiments made by A. G. Bell to ascertain whether extra nipples could be so developed as to become functional, and whether sheep with four functional nipples were more prolific than other sheep, are reported. In the original flock those that bore twins constituted 24 per cent of the normally nipped and 43 per cent of the abnormally nipped ewes. After several years of selection most of the ewes born possessed four functional mammae, and some had from 5 to 8 nipples. The multi nipped sheep have not proved to be more fertile than the others. Twin lambs though smaller at birth often overtake single lambs by autumn.

**Caracul sheep**, A. PIROCHI (*Bol. Uffic. Min. Agr., Indus. e Com.* [Rome], 7 (1908), IV, No. 4, pp. 407–420). In this article the author describes the characteristics of these sheep and their geographical distribution. He thinks

that they should be imported to Italy for experimentation in acclimatization and crossing.

**Origin of the Australian Merino** (*Queensland Country Life, Spec. No.*, 1908, Dec., pp. 17, 18).—This outlines the history of Merino sheep in Australia since their first introduction into that country in 1787.

**Australian sheep**, J. P. BRAY (*Daily Cons. and Trade Rpts. [U. S.]*, 1909, No. 3401, pp. 5, 6).—This is a statistical review of the sheep industry of Australia by the consul-general at Sydney.

**Steamed v. dried potatoes as a feed for swine**, M. SCHMOEGER (*Landw. Vers. Stat.*, 69 (1908), No. 5-6, pp. 359-391).—In these experiments with swine the basal ration consisted of split peas, fish meal, and skim milk. When steamed potatoes were added to the basal ration the daily gain was 0.584 kg. (about 1.28 lbs.) per head, at a cost of 0.5267 mark per kilogram (about 5.7 cts. per pound). With potato flakes as a supplement the corresponding gain was 0.563 kg., at a cost of 0.547 mark per kilogram; with softened potato chips 0.519 kg., at a cost of 0.594 mark; and with steamed potato chips 0.647 kg., at a cost of 0.5778 mark.

**The horse in history**, B. TOZER (*London*, 1908, pp. XX+304, pls. 25).—This book traces "the progress of the horse from very early times down to the present day, mainly from the standpoint of the effect its development had upon the advancement of the human race."

**Army remounts**, M. A. O'CALLAGHAN (*Agr. Gaz. N. S. Wales*, 20 (1909), No. 2, pp. 99-110, figs. 15).—Descriptions of types of horses required for remounts in the English army.

**Age of trotting horse sires**, F. R. MARSHALL (*Amer. Nat.*, 43 (1909), No. 505, pp. 50-53).—The author discusses Redfield's dynamic theory of development, and takes the view that as the average age of sires of 2.10 trotting horses is about the same as that of the first thousand in the index digest, the records reveal no superiority of the old sire over the younger one.

**Southern poultry guide or forty years with poultry**, C. HUSSELMAN (*Richmond, Va.*, 1908, pp. 119, pl. 1, figs. 20).—This is a practical treatise on the care and management of poultry, which is written more particularly for the people of the South who are engaged in this industry.

**Poultry and eggs for market and export**, D. D. HYDE (*New Zeal. Dept. Agr. [Pamphlet]*, 1908, pp. 51, pls. 8, figs. 28).—This pamphlet is intended as a handy guide to practical methods of poultry keeping in New Zealand.

**Poultry and eggs**, F. R. MOWRER and R. P. SKINNER (*Daily Cons. and Trade Rpts. [U. S.]*, 1909, No. 3400, pp. 8-12).—The consul-general at Copenhagen reports that the growing demands of British markets have stimulated poultry raising in Denmark. Danish eggs to the value of \$8,800,000 are annually consumed in England.

The consul-general at Hamburg reports that Germany imports about 3,500,000,000 eggs, principally from Russia, Asia Minor, and Egypt, and thinks that America could participate in this trade. Methods of preparing eggs for export are described.

**The Buff Orpington duck**, A. G. GOODACRE (*Rel. Poultry Jour.*, 16 (1909), No. 1, pp. 12, 75, fig. 1).—This article describes the characteristics of a new breed of ducks which originated in England a few years ago.

**The care and breeding of rabbits**, P. MAHLICH (*Kaninchenzucht und Kaninchenhaltung. Hanover*, 1908, pp. 68, figs. 11).—This book contains brief descriptions of the different breeds of rabbits, with notes on their feeding, care, and management.

## DAIRY FARMING—DAIRYING—AGROTECHNY.

Investigations on the influence of feed on the milk secretion of cows, A. BUSCHMANN (*Landw. Jahrb.*, 37 (1908), No. 6, pp. 899-959).—This is a series of studies on the effect of feeding sunflower cake, coconut cake, wheat bran, and cotton-seed cake on the yield of milk and the characteristics of butter fat.

In the first experiment, with 18 cows, when coconut cake was replaced by sunflower cake the quantity of milk and the percentage of fat decreased, the saponification number of the butter fat was lowered, and the iodine number raised. In another experiment 4 cows were fed for three periods. In the first period while sunflower cake was the supplementary feed the percentage of fat in the milk was 3.01. In the second period when sunflower cake was replaced by coconut cake the percentage of fat was 3.13. In the third period the ration was the same as in the first and the fat decreased to 3 per cent.

In another experiment with three groups of 7 cows, when sunflower cake was replaced by coconut cake the yield of milk and the percentage of fat increased. When replaced by wheat bran there was a decrease in quantity and quality of milk. When cotton-seed cake was substituted for sunflower cake there was a correlation between the saponification and iodine values of the feed and of the butter fat, but no correlation of melting points. Nine out of 10 cows showed an increase in the quality of the milk when cotton seed was substituted for sunflower cake. Compared with coconut cake the cotton seed decreased the yield of milk but increased the percentage of fat.

A further study was made of the effect of feed on the properties of butter fat. When the cotton seed replaced sunflower cake the Reichert-Meissl number, saponification number, and melting point were raised, but the iodine number was lowered. The author concludes that a part of the fat of the food must be absorbed as such, but that the fat of the milk is affected by influences yet unknown. The quality of the butter apparently depends more upon the character of the food than on the amount of volatile fatty acids that it contains.

The protein requirement for milch cows, P. DERWA (*Rev. Gén. Agron.*, n. ser., 3 (1908), No. 11, pp. 455-458).—From experiments in feeding 8 cows on rations containing different amounts of protein, the author concludes that a ration should contain 1 gm. of digestible protein for each kilogram of live weight plus 50 gm. for each liter of milk produced.

A local cow census (*Hoard's Dairyman*, 40 (1909), No. 5, pp. 146, 147).—The cost of feeding and the income from 50 herds of cows belonging to patrons of the creamery at Barron, Wis., for the year 1908 is presented in tabular form and the results discussed. The average number of cows in a herd was 10.6, the average cost of feed per cow \$28.76, the average cash return from the creamery per cow \$37.23, the average yield of butter fat per cow 139.5 lbs., the average price of butter fat 26.4 cts. per pound, the average cost of butter fat 21.6 cts. per pound, and the average value of butter fat per \$1 of feed \$1.35. The best herd showed a profit of \$37.72 per cow and the poorest herd an average loss of \$15.63 per cow.

[The cost of transporting a quart of milk], W. A. GRAUSTEIN (*New England Farmer*, 88 (1909), No. 10, p. 3).—According to a milk contractor's estimate the average cost of transporting milk within the radius of 100 miles of Boston is 1.19 cts. per quart.

The business of dairying, C. B. LANE (*New York and London, 1909*, pp. XII + 234, pl. 1, figs. 46, dgm. 2).—The information contained in this book has been obtained largely from the author's experience and has been prepared for

the use of dairy students, purchasers and handlers of milk, and all who make dairying a business. After a short introduction on the farmer as a business man, the work is divided into six parts as follows: The soil, crops, the dairy herd, feeds and feeding, products, and sales. Considerable space is given to presenting forms and methods of keeping accurate accounts of expenditures and receipts in each line of work undertaken on the dairy farm.

Works on the science and practice of dairying during the first half of 1908, R. W. RAUDNITZ (*Separate from Monatsschr. Kinderheilk.*, 7 (1908), No. 7, pp. 46).—This is a critical review of the literature on dairying published during this period.

Report of the dairy and cold storage commissioner, J. A. RUDDICK (*Rpt. Dairy and Cold Storage Comr. Canada, 1908*, pp. 160, pls. 15).—This report contains statistical matter on the progress of dairying, records of cow-testing associations, and an account of a visit to Great Britain and Holland.

Dairy production, 1907, A. BLUE (*Census and Statis. [Canada] Bul.* 7, pp. IX+14+X).—The statistics in this bulletin are compiled from the returns of 3,516 butter and cheese factories and 7 factories producing condensed milk and cream.

The value of the products of these factories is increasing annually, yet the dairying season of 1907 was not a good one owing to the prevailing drought in some localities. The text of the bulletin is also printed in French.

The past, the present, and the future of the dairy industry in the province of Quebec, J. C. CHAPPAIS (*Rpt. Dairymen's Assoc. Prov. Quebec*, 25 (1906), App., pp. 3-39, figs. 56).—This is a lecture before the twenty-fifth annual convention of the dairymen's association, February, 1906.

Dairying in Denmark, 1907, B. BÖGGILD (*Tidsskr. Landökonomi*, 1908, No. 4, pp. 225-243).—The annual report of the professor of dairying in the Royal Veterinary and Agricultural College at Copenhagen.

Dairying in Norway prior to 1905, S. J. BENTERUD, J. GRUDE, and E. E. WOLD (*Mejeridriften i Norge indtil Aaret 1905. Christiania, 1908*, pp. 234; rev. in *Mælkeritid.*, 21 (1908), No. 49, pp. 969-976).—An historical sketch of the Norwegian dairying industry, its development and present conditions.

Swedish dairying, A. OESTERGREN (*Nord. Mejeri Tidn.*, 23 (1908), Nos. 46, pp. 543-545; 47, pp. 555-556).—An address delivered before the Swedish Dairy Instructors' Association. Statistics of the present conditions of the Swedish dairying industry and its progress during the past 15 years are given, with suggestions as to its future development. It is shown that there were 1,575 creameries in Sweden in 1905; these were supplied in the aggregate with 918,094,785 kg. (about 242,377,000 gals.) of milk from 1,763,857 milch cows. The average amount of milk handled per creamery daily is 1,335 kg. (about 352 gals.), ranging from 232 to 5,560 kg. Of the number of creameries given 470 were cooperative. The total number of patrons of the creameries was 70,647.

New Zealand dairy produce on the British market, D. CUDDIE (*New Zeal. Dept. Agr., Dairy Div. Bul.* 12, pp. 45).—This is a report of a visit to Great Britain, Denmark, Canada, and the United States with the view to obtain information that would be of value to New Zealand dairymen.

Biological and biochemical studies of milk, C. J. KONING (*Biologische und Biochemische Studien über Milch. Leipzig, 1908*, No. 2, pp. 98, charts 2).—This has been reported from another source (*E. S. R.*, 19, pp. 371, 372).

Essentials of milk hygiene, C. O. JENSEN, trans. and amplified by L. PEARSON (*Philadelphia and London, 1909*, 2. ed. rev., pp. X+291, figs. 24).—This is the second edition of a work previously noted (*E. S. R.*, 19, p. 275). "A few corrections and changes have been made in the text and new matter has been

added to give in detail what may be regarded as the official method for the examination of milk for bacteria and cells."

Milk as affected by stable practices and subsequent handling, M. H. REYNOLDS (*Amer. Vet. Rev.*, 32 (1908), No. 6, pp. 690-709, figs. 3, dgms. 3).—This is a paper read before the American Veterinary Medical Association at its forty-fourth annual meeting and previously reported (*E. S. R.*, 19, p. 199).

The influence of the sugars on the secretion of milk, G. PIANTONI (*Arch. Farmacol. Sper. e Sci. Aff.*, 7 (1908), Nos. 7, pp. 329-336; 8-9, pp. 337-364).—Hypodermic injections of disaccharids administered to a goat produced effects that varied with the amount injected. A small dose increased the amount of milk secreted without altering the proportion of its constituents. Larger doses diminished the quantity of milk and the percentage of milk sugar, and decreased slightly the percentage of fat, but increased the flow of urine which showed traces of sugar. Monosaccharids produce similar effects provided double the quantity is used. The sugar contained in the urine of the goat is lactose, which conforms with the assertion of Porcher.

On the variability of milk, G. VON WENDT (*Skand. Arch. Physiol.*, 21 (1908), No. 2-3, pp. 89-145; *Mitt. Landw. Inst. Leipzig*, 1908, No. 9, pp. 127-179).—Various salts were added to the rations of milch cows and their effect upon the chemical composition of the milk was studied. Some of the author's conclusions are as follows:

Common salt, carbonate of lime, sodium phosphate, magnesium bromid, and calcium glycono-phosphate appeared to have no influence on the composition of milk. Acid calcium phosphate appears sometimes to influence favorably the amount of fat and to increase the relative amount of original calcium. The percentage of albumin does not increase toward the end of the lactation period. Phosphorus, total nitrogen, and casein are the least variable, while chlorin, potassium, and albumin are the most variable of milk constituents.

The effect of rutting on the composition of cow's milk, O. MEZGER (*Ztschr. Untersuch. Nahr. u. Genussmit.*, 16 (1908), No. 5, pp. 273-281).—The author made chemical analyses of the milk of seven cows during the rutting period and found that such variations as occur are largely due to the individuality of the cows. In no case did the amount of fat-free dry matter vary to any extent.

On the composition of cow's milk of different breeds, with special reference to the lime and phosphoric acid content, T. KATAYAMA (*Landw. Vers. Stat.*, 69 (1908), No. 5-6, pp. 342-358).—Analyses were made of milk from cattle of Roumania, Ceylon, Korea, Africa, and different German breeds, and from the buffalo. There was a great variation between individuals of the same breed, but in the same individual the lime and phosphoric acid content varied but little from time to time. The lime content varied from 0.113 per cent in the East Prussian Holland breed to 0.227 in the black and white East Frisian. The phosphoric acid varied from 1.53 per cent in the buffalo to 0.299 in the Korean cattle.

On the variations of the globules of milk, G. ALESSI and E. CARAPELLE (*Rev. Hyg. et Méd. Infant.*, 7 (1908), No. 4, pp. 309-329, pls. 3).—A microscopic examination was made of milk from the goat, dog, guinea pig, and cow, as well as of human milk. The globules varied much in form and in size under normal as well as abnormal conditions. In some cases the fatty substance did not appear to fill the entire globule, while in other cases the presence of a viscous material caused the globules to form clusters. Pathological conditions cause many changes in the form and character of the globules.

Investigations on the viscosity and surface tension of milk, B. KOBLER (*Arch. Physiol. [Pflüger]*, 125 (1908), No. 1-2, pp. 1-72, figs. 5; *abs. in Rev.*

*Gén. Lait*, 7 (1909), No. 10, pp. 234-236).—According to the author both the surface tension and capillarity in milk are constant for a given animal under ordinary conditions, but are influenced by the character of the feed and other factors. The viscosity of milk depends upon the chemical composition and a number of physical properties. During the gestation period the viscosity gradually increases but rapidly diminishes a few days after calving.

The application of new physico-chemical methods of milk investigation from the socio-medical and physiological standpoint, H. ZANGER (*Schweiz. Arch. Tierheilk.*, 50 (1908), No. 5, pp. 247-267; *abs. in Milchw. Zentbl.*, 5 (1909), No. 2, pp. 86, 87).—This article discusses the methods of determining physical constants previously reported by Schnorf (*E. S. R.*, 16, p. 1016), and in the article noted above. Their importance for detecting adulterated and pathological milks is pointed out. The conclusions reached are based on the examination by the author and his assistant of 10,000 samples of milk.

Investigations on the rennet coagulation of milk, W. VAN DAM (*Rev. Gén. Lait*, 7 (1908), Nos. 6, pp. 121-129; 7, pp. 145-155; 8, pp. 169-178; *Ztschr. Physiol. Chem.*, 58 (1909), No. 4, pp. 295-330, *dgms.* 3).—Investigations were undertaken to discover the cause of variation in the coagulability of milk. By diluting milk with water or by adding a soluble citrate the time of coagulation was lengthened. The addition of a soluble oxalate rendered the milk incoagulable. On the other hand, the addition of calcium chlorid hastened coagulation. The author concludes that the time of coagulation is inversely proportional to the concentration of hydrogen in the milk.

The effect of some normal elements of milk on its coagulation with rennet, C. GERBER (*Compt. Rend. Soc. Biol. [Paris]*, 65 (1908), No. 26, pp. 182-184).—The addition of lacto-casein and lactose retarded coagulation. Adding sodium chlorid and potassium chlorid in either small or large quantities hastened coagulation, but in medium quantities retarded it.

Further contributions to the theory of the coagulation of milk by rennet, G. WERNCKEN (*Ztschr. Biol.*, 52 (1908), No. 1-3, pp. 47-71, *dgms.* 16).—After a study of the optical properties of milk and casein and their ability to combine with hydrochloric acid and alkali, both before and after adding rennet, the author does not agree with Laqueur that casein splits into paracasein and milk albumin. On the contrary, his results agree with Petry and Spiro (*E. S. R.*, 18, p. 475).

Microscopical studies of the colostrum of cow's milk, P. SCHULZ (*Ztschr. Fleisch. u. Milchhyg.*, 19 (1908), No. 2, pp. 55-61; 19 (1909), No. 4, pp. 132-145; *abs. in Rev. Gén. Lait*, 7 (1909) No. 9, p. 210; *Molk. Ztg. [Hildesheim]*, 23 (1909), No. 5, p. 110; *N. Y. Produce Rev. and Amer. Cream.*, 27 (1909), No. 16, p. 654).—The author reviews the literature on this subject and gives the results of his own investigations. Some of his conclusions are as follows:

The colostrum bodies disappear from the third to the eleventh day after calving, the length of time which they remain being independent of breed, yield of milk, age of the cow, nature of the feed, or the length of the dry period. During the first lactation period they remain longer than in the succeeding periods. They persist longer if the milking is imperfect or the secretion of milk is interfered with in any way. Occasionally they may persist in some cows during the entire lactation period.

Analyses of colostrum, M. SIEGFELD (*Molk. Ztg.*, 22 (1908), No. 45, p. 1234; *abs. in Milchw. Zentbl.*, 5 (1909), No. 1, pp. 37, 38).—These analyses show a great range in chemical composition. The variations are due to the individuality of the cow and the length of time between calving and the milking period. The specific gravity varied from 1.031 to 1.083, the percentage of fat from 4.7 to 12, the protein from 5.42 to 23.75, and the carbohydrates from 1.60 to 3.50.

The proteolytic enzym of human milk, A. E. AUSTIN (*Jour. Med. Research*, 19 (1908), No. 2, pp. 309-319).—Samples of milk from 21 persons at different periods of lactation were examined to determine why breast milk often disagrees with the healthy infant. No enzymes were found by Volhard's method, employed for trypsin. A modification\* of Rietschel's method was employed for the determination of rest nitrogen (nonprotein nitrogen). The results were variable and inexplicable.

"Before the subject here treated can be fully settled we must know more of the character of this rest nitrogen, and the most attractive feature is the possibility of the presence of amino acids." As a test for amino acid a combination of Ackermann and Levene's method was employed. No free glycol, alamin, nor leucin were found. The results are summarized as follows:

"There is no evidence of autodigestion of human milk, at least under the conditions pertaining to such digestions in organ tissues.

"The digestive disturbances of infants fed on human milk can have no relation to such an enzym, as the milk of both healthy and sick women was examined.

"The rest nitrogen is still a riddle, though if amino acids compose a part of it they are remnants of a synthesis to protein, and not products of digestion of milk protein."

On the nucleon content of human milk, A. VALENTI (*Arch. Farmacol. Sper. e Sci. Aff.*, 7 (1908), No. 10, pp. 447-459, charts 2; abs. in *Chem. Zentbl.*, 1909, I, No. 2, p. 93).—The author found that the average percentage of nucleon in human milk with three subjects tested three times a month was 0.1302, 0.1339, and 0.1305, respectively, and appeared to vary inversely with the amount of milk. The maximum amount of nucleon was in the first two or three months of lactation.

On milk secretion and the microscopical testing of milk, W. WINKLER (*Ztschr. Landw. Versuchsw. Österr.*, 11 (1908), No. 6, pp. 562-630, pls. 4; abs. in *Fühling's Landw. Ztg.*, 57 (1908), No. 19, p. 672).—The results of a microscopical study of milk and the tissues of the mammary glands are reported and the work of other investigators is reviewed.

The author could distinguish four different cellular layers in the sections of the alveolus, as follows: (1) The membrana propria, described by Fürstenberg, which is composed of connective tissue; (2) a layer of muscular fibers that can contract the alveolus and force out the secretion; (3) a merismatic layer wherein nuclear division is very active during the lactation period; and (4) a layer of secretory epithelial cells.

The author believes that fat globules have a firm membrane, and that the "lactokonien" of Kreidl are granules of casein. Rancid milk may sometimes be caused by irregular-shaped fat globules formed in the udder. Leucocytes and lymphocytes are seldom found in milk. A distinction should be made between leucocytes and epithelial cells of milk.

Slimy milk, L. EBERLEIN (*Pure Products*, 4 (1908), No. 11, pp. 494-499).—This is a review of bacteriological investigations on the causes of slimy and colored milk.

Fermentations of milk and cheese, A. KOCH (*Jahresber. Gärungs-Organismen*, 16 (1905), pp. 259-351).—A review of the articles on this subject for 1905.

On lactic-acid fermentation in milk, M. W. BELJERINCK (*K. Akad. Wetensch. Amsterdam, Proc. Sect. Sci.*, 10 (1907), pt. 1, pp. 17-34).—This is mainly a discussion of the properties of different types of lactic acid bacteria.

Lactic acid as an agent to reduce intestinal putrefaction, P. G. HEINEMANN (*Jour. Amer. Med. Assoc.*, 52 (1909), No. 5, pp. 372-376).—The work of Metchnikoff and other observers is reviewed. The author's investigations with steril

ized milk, self-coagulated milk, and the commercial preparations known as lactobacilline, fermentlactyl, kefilac, yoghourt, and latone led him to think, that so far as the therapeutic effect is concerned, there is yet no convincing evidence that sour milk prepared with commercial cultures is preferable to naturally soured milk. Yeasts were present in all but one of the commercial preparations.

Colloidal cream and process of making the same, L. M. ROUSSEAU (*French Patent 392,253, Sept. 20, 1907; Jour. Soc. Chem. Indus., 27 (1908), No. 24, p. 1218*).—This is a patented process by which a colloidal preparation of casein containing 66 per cent of water is obtained by subjecting skim milk to centrifugal action. A sufficient amount of this preparation is added to fresh cream to make the total amount of casein in the product equal to one-fourth of the weight of the fat. The mixture is then heated to about 65°, homogenized under a pressure of 150 to 300 kg., and then sterilized.

The preservative action of boric acid in butter, M. A. O'CALLAGHAN (*Apr. Gaz. N. S. Wales, 19 (1908), No. 12, pp. 1033-1035; 20 (1909), No. 2, pp. 148, 149*).—Experiments were undertaken to determine the proper quantity of boric acid to add to butter for preservative purposes without injuring the flavor or other qualities.

Ninety lbs. of butter was divided into three portions. To the first portion was added 3 per cent of salt; to the second, 3 per cent of salt and 0.25 per cent of a preservative consisting mainly of boric acid; and to the third portion, 3 per cent of salt and the preservative at the rate of 0.5 per cent. The butter was then worked in the ordinary manner.

At the end of 3 months the third portion would just pass for a first quality of frozen butter as regards flavor. The second portion showed evidences of decomposition, while the first portion was distinctly third class in flavor. Chemical analyses showed that about one-half of the boric acid was lost in working. A repetition of the experiment gave similar results.

[The effect of cold storage on the changes in butter], L. A. ROGERS (*Ice and Refrig., 36 (1909), No. 1, pp. 9-11, charts 3*).—This is a lecture before the eighteenth annual convention of the American Warehousemen's Association, held at Washington, D. C., December, 1908. According to the author's experiments so far it would seem that the condition of butter, after remaining in cold storage, is much more dependent on the methods of manufacture than on the storage temperature.

Butter, A. MCGILL (*Lab. Inland Rev. Dept. Canada Bul. 170, pp. 19*).—This bulletin reports the analyses of 295 samples of butter.

A study of Argentine butters, P. LAVENIR (*Crón. Agr. [Argentina], 2 (1908), No. 7-9, pp. 103-107*).—The physical and chemical properties of 8 samples of butter are determined and presented in tabular form.

Danish butter exports, 1907-8, B. BÖGGILD (*Tidsskr. Landökonomi, 1908, No. 13, pp. 649-659*).—This is the usual annual review of the conditions of the Danish butter trade published by the author.

The imports of butter during the year ending September 30, 1908, were 31,192,000 Danish pounds, 21,000,000 of which came from Russia (largely Finland). The net exports amounted to 169,700,000 lbs., an increase of 8,600,000 lbs. over the exports of the preceding year, and the gross exports to 200,800,000 lbs. Of this quantity 183,970,000 lbs. went to England, an increase of a little over 6,000,000 lbs. over the figure for the preceding year. The domestic production of oleomargarine was 54,220,000 lbs. and the imports 6,570,000 lbs., making a total of 60,790,000 lbs. of oleomargarine consumed in Denmark during the year.

The average price received for the butter during the year was about 103 öre per pound (25.1 cts. per pound avoirdupois), an increase of about  $6\frac{1}{4}$  öre (1.7 cts.) over the average price received during 1906-7.

Denmark's butter exports during the last 25 years, B. BÖGGILD (*Ugeskr. Landm.*, 53 (1908), No. 4, pp. 47-49).—A review of the development of the industry since 1882, with statistics.

**Refrigeration and Siberian butter** (*Milch Ztg.*, 37 (1908), No. 45, p. 533).—This is an account of the recent growth of the dairy industry in Siberia, which is already a successful competitor with Denmark and Holland in the London butter market. At the present time 36,000,000 kg. (about 8,182 tons) of butter are sent annually from Siberia to London and the amount is constantly increasing, this being due to improved methods, cheap transportation, and refrigeration.

**The science and practice of cheese making**, L. L. VAN SLYKE and C. A. PUBLOW (*New York*, 1909, pp. XVI+483, pl. 1, figs. 55).—This work is intended as a text-book for students and as a reference book for the practical cheese maker. A large amount of space is devoted to Cheddar cheese making. The work is divided into five parts, viz, the manufacture of American Cheddar cheese, defects of American Cheddar cheese, the science of cheese making, methods of making different varieties of cheese, and methods of testing, factory organization and literature.

**Cheese making**, J. W. DECKER, edited by F. W. WOLL (*Madison, Wis.*, 1909, rev. ed., pp. 211, pl. 1, figs. 93).—This is a fifth edition of this work. Among the new subjects discussed are the cold-curing and paraffining of Cheddar cheese, the use of the acidimeter, Hart's test for casein in milk, a synopsis of defects in American Cheddar cheese, and the manufacture of Camembert, Gouda, Italian, potted, sage and other kinds of fancy cheese.

**Cheese**, A. MCGILL (*Lab. Inland Rev. Dept. Canada Bul.* 171, pp. 21).—Analytical data regarding 237 samples of cheese are reported. Seventy-four per cent of the samples contained from 44 to 48 per cent of fat.

**Some analyses of cream cheese**, C. H. CRIBB (*Analyst*, 34 (1909), No. 395, pp. 45-48).—The fat from 28 samples of cream cheese ranged from 0.63 to 75.6 per cent, though all but four samples were apparently made from whole milk or from a mixture of cream and milk.

**The fat in cheese**, G. CORNALBA (*Indus. Latt. e Zootec.*, 7 (1909), No. 2, pp. 23, 24).—Analyses of 31 samples of different kinds of Italian cheese are reported. The percentage of water ranged from 16.6 to 60, the fat from 8.2 to 41.5, and the protein from 16.3 to 50.9.

**The fat content of Edam cheese**, L. MÜLLER (*Molk. Ztg.*, 22 (1908), No. 35, pp. 997-999).—This is a discussion of the factors which influence the fat content of cheese and the methods of estimating it. Analyses of Edam and Limburger cheeses are also reported.

**The cheese industry of Normandy**, BEAU (*Indus. Lait.*, [Paris], 33 (1908), No. 36, pp. 651-656).—This is a discussion of the adaptability of the fertile soil in the Auge Valley. The cattle are chiefly of the Normandy breed. The principal dairy product is Camembert cheese, which had its origin in this region, having been first made in 1791.

**The cheese industry in the Rhine Province** (*Dept. Landb., Vijr. en Handel. Verslag. en Meded. Dir. Landb.* [Netherlands], 1908, No. 6, pp. 85-102).—A general survey of the growth of the cheese industry in that region since 1825.

**Casein and its applications**, F. W. RICHARDSON (*Jour. Soc. Dyers and Colourists*, 25 (1909), No. 1, pp. 4-8; abs. in *Jour. Soc. Chem. Indus.*, 28 (1909),

No. 3, p. 137).—In this article the methods of using casein for sizing cotton warps, for dressing for cotton and linen fabrics, and for waterproofing are discussed. Casein may also replace albumin in calico printing. Mention is made of the production of a noninflammable photographic film from casein and the possibility of its employment to "animalize" cotton so that it may dye like wool.

The characteristics of red currant seed oil, R. KRŽIZAN (*Chem. Rev. Fett u. Harz Indus.*, 16 (1909), No. 1, pp. 1-3; *abs. in Jour. Soc. Chem. Indus.*, 28 (1909), No. 2, p. 97; *Analyst*, 34 (1909), No. 396, p. 101).—"The air-dried seeds of Italian and Bohemian red currants yielded on extraction with petroleum spirit 16 and 18.5 per cent of oil, respectively. In each case the oil was of an orange-yellow color and had an odor resembling that of linseed oil. In the film test the oils dried in 3 to 4 days, yielding an elastic skin." Other values of these oils are also given.

Oil from "Carapa guyanensis" (*Carapa procera*, DC.), J. LEWKOWITSCH (*Analyst*, 34 (1909), No. 394, pp. 10, 11; *abs. in Jour. Soc. Chem. Indus.*, 28 (1909), No. 3, p. 150).—Physical and chemical properties of this oil are given.

The rate of fermentation of ciders and perries, B. T. P. BARKER (*Jour. Agr. Sci.*, 3 (1908), No. 1, pp. 1-21).—A study was made of the influence of various factors on the rate of fermentation. The main factor appears to be the amount of nitrogenous matter present in the juice which is assimilable by the yeast. The variety of fruit, state of ripeness, aeration of the juice, and temperature also have some influence, but the kind of yeast and the chemical constituents in the juice other than nitrogenous compounds do not appear to be influential factors. A certain measure of control over the rate of fermentation can be exercised by the cider maker.

Acetic aldehyde in wine, its origin, and its significance, A. TRILLAT (*Ann. Inst. Pasteur*, 22 (1908), Nos. 9, pp. 704-719; 10, pp. 753-762; 11, pp. 876-895; *Bul. Assoc. Chim. Sucr. et Distill.*, 26 (1909), No. 8, pp. 654-690).—The author reviews the work of other investigators, and describes in detail his own experiments concerning the various factors which influence the amount of acetic aldehyde in wines and brandies. Acetic aldehyde is formed by the oxidation of alcohol under the influence of the air and participates more or less in all the principal modifications which take place in wine.

Malic acid in wine making. Malo-lactic fermentations, W. MESTREZAT (*Jour. Pharm. et Chim.*, 6. ser., 28 (1908), No. 1, pp. 13-20).—After reviewing the work on this subject the author maintains that a malo-lactic fermentation does not necessarily take place because of the disappearance of malic acid.

Report of the Swiss experiment station for horticulture and wine making at Wädenswil for 1905-6, H. MÜLLER-THURGAU (*Landw. Jahrb. Schweiz*, 22 (1908), No. 14, pp. 745-920, figs. 10).—This is the annual report of work done at this station on the diseases of fruits, variety tests of grapes, wine fermentation, tests of different kinds of yeasts, and related topics.

Agricultural and industrial distillation, E. BOULLANGER (*Industries de Fermentation Distillerie Agricole et Industrielle. Paris, 1909, pp. XI+554, figs. 107*).—This work treats of the distillation of industrial alcohol, brandies, and rums both from the practical and theoretical standpoint. The principal topics treated are the properties and uses of alcohol, methods of determining the chemical composition of beets, molasses, fruits, and other materials used in distilling, the methods of preparing and fermenting different musts, the distillation and rectification of alcohol, and the composition and utilization of by-products of distilleries. There is some statistical information on the alcohol industry and also a chapter on alcoholometry.

## VETERINARY MEDICINE.

Veterinary materia medica and therapeutics, K. WINSLOW (*New York, 1908, 6. ed., rev. and enl., pp. VIII+859*).—A sixth revised edition of this work of which that part of the text treating of the physiological action of drugs has been almost completely rewritten on the basis of recent pharmacological investigations.

Further studies upon anaphylaxis, M. J. ROSENAU and J. F. ANDERSON (*Pub. Health and Mar. Hosp. Serv. U. S., Hyg. Lab. Bul. 45, pp. 65; abs. in Jour. Med. Research, 19 (1908), No. 1, pp. 37-66; Bul. Inst. Pasteur, 6 (1908), No. 18, pp. 827-829*).—"The period of incubation of serum anaphylaxis is about 7 days in guinea pigs sensitized in the brain and about 9 days in guinea pigs sensitized subcutaneously. It also appears that the sensitization comes on somewhat gradually. . . . The sensitizing principle is gradually influenced by heat. It disappears almost entirely when horse serum is heated to 100° C. for 1 hour. . . . The toxic principle in horse serum is gradually destroyed by heat. . . . The toxicity of horse serum does not appear to diminish with the age of the serum. . . .

"The specific nature of anaphylaxis is further shown by various experiments. . . . A substance known as 'anaphylactin' is present in the blood serum of sensitized guinea pigs. This substance is not present during the period of incubation. We have been unable to demonstrate the presence of anaphylactin in the blood serum of man, the monkey, and the cat. . . . We believe that these morphological alterations do not explain the mechanism of anaphylaxis. It is probable that the mechanism will not be unraveled until further light is shed upon the chemistry of protein metabolism. . . . The repeated injection of small amounts of horse serum sensitizes guinea pigs. Repeated injections of large amounts render guinea pigs partially immune. . . . We suggest a possible relation between the toxemias of pregnancy and anaphylaxis."

Investigations of the leucocytes and lymphoid tissue of invertebrates, M. KOLLMANN (*Ann. Sci. Nat. Zool., 9. ser., 8 (1908), No. 1-4, pp. 1-6*).—The investigations are reported in three parts. Part 1 is devoted to a review of the literature and to important questions of technique. In part 2 details are given of the results of studies in the various groups while in part 3 is found a synthetic review of the investigation and the conclusions therefrom. A bibliographical list is given.

Further notes on rat leprosy and on the fate of human and rat lepra bacilli in flies, W. B. WHERRY (*Jour. Infec. Diseases, 5 (1908), No. 5, pp. 507-514*).—While engaged in plague work in California the author made careful search for leprosy in rats in view of the possibility of blood-sucking insects playing some rôle in the transmission of the disease. Out of 9,361 rats dissected during a period of 4 months in the summer of 1908, 20 were found infected with leprosy. There is said to be no evidence, however, that human leprosy and rat leprosy are identical or that human beings need fear infection from leper rats.

Experiments were made in which flies in the larval and adult stages were fed upon the carcass of a leper rat. Both stages were found to ingest the bacilli in enormous numbers. The bacilli did not appear to multiply in the flies (*Calliphora vomitoria*, *Lucilia caesar*, and *Musca domestica*) as they were clear of bacilli in less than 48 hours.

Larvæ of *C. vomitoria* heavily infested did not appear to be capable of developing further than the nymphal stage. "A fly caught on the face of a human leper was found to be infested with leper-like bacilli. These were few in num-

ber at the beginning of the observation, but on the third day more than 1,152 were present in each speck deposited. Only one bacillus was found between the third and sixth day and the acid-proof bacilli were not infective when injected into the subcutaneous tissue of a guinea pig."

The etiology and diagnosis of hydrophobia, ANNA W. WILLIAMS and MAY M. LOWDEN (*Ann. Rpt. Dept. Health City of New York, 1906, vol. 2, pp. 635-671*).—Some of the conclusions drawn by the authors following the investigation here reported are:

"The smear method of examining the Negri bodies is superior to any other method so far published. . . .

"The Negri bodies as shown by the smears as well as by the sections are specific to hydrophobia.

"Numerous 'bodies' are found in fixed virus. 'Bodies' are found before the beginning of visible symptoms—i. e., on the fourth day in fixed virus, on the seventh day in street virus, and evidence is given that they may be found early enough to account for the appearance of infectivity in the host tissues. Forms similar in structure and staining qualities to the others, but just within the limits of visible structure at 1,500 diameter magnification have been seen. Such tiny forms, considering the evidence they give of plasticity, might be able to pass the coarser Berkefeld filters.

"The Negri bodies are organisms belonging to the class Protozoa. The reasons for this conclusion are: (a) They have a definite characteristic morphology; (b) this morphology is constantly cyclic, i. e., certain forms always predominate in certain stages of the disease, and a definite series of forms indicating growth and multiplication can be demonstrated; (c) the structure and staining qualities as shown especially by the smear method of examination resemble that of certain known Protozoa, notably of those belonging to the suborder Microsporidia. The proof that the 'Negri bodies' are living organisms is sufficient proof that they are the cause of hydrophobia."

The prevalence of hydrophobia in the Philippine Islands, F. W. DUDLEY (*Jour. Amer. Med. Assoc., 51 (1908), No. 25, pp. 2143-2149*).—In response to circulars mailed by the author, cases which largely occurred between October 1, 1902, and February 28, 1907, were reported as follows: In 253 dogs, 3 cats, 1 carabao, 1 cow, 4 horses, 2 pigs, 3 rats, and 1 monkey. Thirty-nine provinces were shown to have been infected by the disease, 16 having escaped according to reports. The author considers the disease sufficiently prevalent to warrant the Government in providing means for the Pasteur treatment.

Transmission of rabies to mice by ingestion, P. REMLINGER (*Compt. Rend. Soc. Biol. [Paris], 65 (1908), No. 30, pp. 385, 386*).—Experiments indicate that mice can contract rabies not only when bit by an affected dog or cat but also when they eat virulent parts of an animal dead from the disease.

Experiments on the production of antirabic serum, D. W. POOR and P. J. FRIEDMAN (*Ann. Rpt. Dept. Health City of New York, 1906, vol. 2, pp. 682-692*).—The following conclusions have been drawn from the experiments reported:

"It is possible to produce a strong immune serum against rabic virus, in rabbits, sheep, dogs, and horses.

"For the production of such a serum a long course of treatment is necessary.

"This serum when fresh prolongs the incubation of rabies when injected into test animals a short time after infection."

Note on the investigation of cattle disease in the Protectorate of Sierra Leone, F. HARVEY (*Jour. Roy. Army Med. Corps, 10 (1908), No. 1, pp. 41-44, map 1; abs. in Bul. Inst. Pasteur, 6 (1908), No. 19, p. 883*).—An account of a trypanosomiasis that is apparently fatal to cattle, horses, dogs, goats, and prob-

ably mules, sheep, and other domestic animals. A description is given of the species, which Mesnil considers as probably *Trypanosoma dimorphon*.

Notes on the duration and course of camel surra, H. T. PEASE and S. H. GAIGER (*Jour. Trop. Vet. Sci.*, 3 (1908), No. 4, pp. 427-433).—The percentage of camels that recover from surra seems to be low. They appear to be in an intermediate stage of tolerance and it is possible that they are gradually acquiring an immunity similar to that of Indian cattle.

Natural canine surra, S. H. GAIGER (*Jour. Trop. Vet. Sci.*, 3 (1908), No. 4, pp. 443-451, charts 11).—Examinations made by the author in India of the blood of several hundred dogs resulted in the finding of but one case of natural surra. A report is presented of the symptoms in this dog and in other animals, including the horse, dog, rabbit, guinea pig, and white mouse, inoculated subcutaneously with blood from the natural case. These inoculations are said to show that the dog was probably infected from the horse.

"In the Punjab we have to deal with only one type of trypanosome but with two strains, a camel strain and an equine strain, which can not be distinguished morphologically, but can be distinguished by the virulence of the disease they produce in animals experimentally inoculated or naturally infected. By a series of inoculations one strain may take on the characters of the other. The 'camel surra' trypanosome by passage through several horses comes up to the standard of virulence of what might be called the 'horse surra' trypanosome."

Treatment of surra by atoxyl and orpiment, J. D. E. HOLMES (*Jour. Trop. Vet. Sci.*, 3 (1908), No. 4, pp. 434-442).—In the experiments here recorded the results obtained by Laveran and Thiroux (*E. S. R.*, 20, p. 579) from the use of atoxyl in subcutaneous injections alternated with trisulphid of arsenic by mouth were confirmed. The horse, guinea pig, and rabbit were used in these experiments.

"Solutions of atoxyl up to 15 per cent can be given intravenously and subcutaneously without injury to the tissue. In our experiments we found that the lower dilutions were preferable, as they were absorbed more readily and caused less irritation at the seat of inoculation. For horses, a 4 per cent solution and for small animals, a 1 per cent solution was adopted. The horse can tolerate 5.5 gm. of atoxyl per 500 lbs. body weight, administered intravenously. Subcutaneously somewhat less than double this amount can be administered without any toxic effect. In the guinea pig 0.06 gm. per 500 gm. body weight is the maximum amount which can be injected subcutaneously with safety. In the treatment of surra with atoxyl it is not necessary to use large doses. About a quarter of the toxic amount is sufficient."

The relation of human and bovine tuberculosis, R. KOCH (*Tuberculosis*, 7 (1908), No. 11, pp. 491-505; *Jour. Compar. Path. and Ther.*, 21 (1908), No. 4, pp. 393-398).—This is a paper presented at the International Congress on Tuberculosis held in Washington, D. C. in 1908.

Attention having been called by Dr. Theobald Smith to certain differences between the tubercle bacilli found in man and cattle, experiments were conducted in cooperation with Schütz. The conclusions arrived at are similar to those presented at the British Congress on Tuberculosis in 1901, viz: "The tubercle bacilli of human tuberculosis are different from those of bovine tuberculosis. Human beings may be infected by bovine tubercle bacilli, but serious diseases from this cause occur very rarely. Preventive measures against tuberculosis should therefore be directed primarily against the propagation of human tubercle bacilli." It is stated that there are many possible sources of error in the work and that it is only when such have been excluded that the results can be accepted as conclusive.

Infection of dogs with human and bovine types of the tubercle bacillus. C. TITZE and O. WEIDANZ (*Tuberkulose Arb. K. Gsndhtsamt.*, 1908, No. 9, pp. 79-92; *abs. in Bul. Inst. Pasteur*, 6 (1908), No. 22, p. 1006).—The authors first consider the statistics relating to the frequency of the disease and review the literature on the subject. From inoculation experiments it is concluded that dogs are very resistant to both the human and bovine types of the bacillus, whatever the manner of introduction. This appears to be a natural immunity possessed even by young dogs. Tuberculous dogs were found to react to tuberculin. A bibliography is appended.

Tuberculosis of parrots and canaries, A. WEBER, C. TITZE, and O. WEIDANZ (*Tuberkulose Arb. K. Gsndhtsamt.*, 1908, No. 9, pp. 59-78; *abs. in Bul. Inst. Pasteur*, 6 (1908), No. 22, pp. 1004, 1005).—Parrots were infected in various ways with the bovine, human, and fowl types of the tubercle bacillus. While they were susceptible to the 3 types, the bovine type was most virulent and the fowl type the least so.

Experiments are also reported in which the 3 types were ingested by canaries. The fowl type was found to be the most virulent.

The ophthalmic reaction to tuberculin, LE D. BAILLIART (*Jour. Compar. Path. and Ther.*, 21 (1908), No. 4, pp. 308-321).—This is a report presented on behalf of the Société de Pathologie Comparée to the International Congress on Tuberculosis held at Washington, D. C., in 1908. The following are the conclusions arrived at:

"The ophthalmic test is a method of diagnosis which is, in general, without danger when applied to eyes that are quite free from any tuberculous lesions. It is sometimes followed by slight and temporary ill effects. The reaction is not always proportionate to the extent of the lesions. It is often absent in the last stages of the disease. It is sometimes followed by systemic disturbance, which is always inconsiderable and lasts only for a short time. Very often the reaction is doubtful. In bovines, because of the difficulties of examination, doubtful cases should be considered negative. . . .

"In bovines the ophthalmic test alone is a very untrustworthy method, and can not pretend to replace the ordinary subcutaneous injection. The secondary ocular reaction gives results which are far superior. In the vast majority of cases the two processes, simple subcutaneous injection and the combined ophthalmic reaction, give the same results.

"Exceptionally, a tuberculous animal does not react to this second ocular test. More frequently one gets a positive ophthalmic reaction in a nontuberculous animal. Although the combined ophthalmic reaction can not replace the subcutaneous injection of tuberculin as a means of diagnosis, it remains a useful method, far more simple, and of genuine utility in certain circumstances."

Five years' experience of protective inoculation against tuberculosis in cattle by von Behring's method, STRELINGER (*Berlin. Tierärztl. Wchnschr.*, 1908, No. 22, pp. 385-388; *abs. in Jour. Compar. Path. and Ther.*, 21 (1908), No. 3, pp. 220-225).—The author reports inoculation experiments conducted at Sávár, Hungary, in which von Behring's directions were punctiliously observed. Attention is called to the importance of choosing only quite young and healthy animals.

"Our experience shows that bovovaccination is capable of conferring marked protection against infection for a period of 5½ years, the percentage of 5½-year-old animals protected by bovovaccination, and which reacted when afterwards submitted to tuberculin, only numbering 10 per cent. whilst before the introduction of protective inoculation 50 per cent of 2-year-old artificially reared animals reacted to tuberculin.

"When we further consider that such good results can also be obtained on farms in which the inoculated calves are constantly kept together with highly tuberculous cows, it is plain that protective inoculation can be carried out with good results under ordinary agricultural conditions, and it seems justifiable to conclude that the power of resistance against tuberculous infection conferred on animals by bovovaccination, having already lasted over 5 years, will probably prove to continue for some years longer.

"Taking everything into consideration, I consider it absolutely superfluous to repeat the protective inoculation every year, as has recently been suggested. According to my view, inoculation should not be repeated even once, on account of the possibility of infection through the milk.

"Instead of repeating the inoculation, I would recommend that, as far as economically possible, suitable hygienic measures should be adopted."

It is pointed out that the danger of animals from tubercle-free farms from becoming infected if removed to other centers obtains under the methods of Bang and Ostertag. It is therefore of great importance that cattle not only be protected from tuberculosis infection, but also that an active resistance be conferred. The author considers a combination of Ostertag's method with von Behring's bovovaccination as the remedy sought for. The following are considered the most important points in such a combined method:

"The most important condition, in my estimation, is that the bovovaccination should be carried out with the most scrupulous care and exactly in accordance with von Behring's directions.

"The method of testing, by tuberculin, the adult animals protected by von Behring's method should be discontinued, and only employed in special cases. For it should be substituted exact clinical tests of the whole number of animals at fixed intervals.

"The tuberculin testing of the calves recommended by Ostertag can in the combined method be discontinued, inasmuch as the bovovaccine injections exhibit an action similar to tuberculin. (I may add that we have often noted that calves which react typically during the protective inoculation have later proved to be infected.)

"By combining the two methods, the artificial rearing of the calves, as recommended by Ostertag, could be discontinued, for our experiments have shown that calves develop just as well under ordinary agricultural conditions as those reared artificially, provided they have been protectively inoculated in early life. This appears to me an advantage of the combined method which should not be overlooked, because in agricultural practice artificial rearing is often difficult to carry out."

The vaccination of cattle against tuberculosis, T. SMITH (*Jour. Med. Research*, 18 (1908), No. 3, pp. 451-485; *abs. in Bul. Inst. Pasteur*, 6 (1908), No. 23, p. 1038).—"Vaccination of calves with the human type of the tubercle bacillus is harmless. Cases in which injuries are said to have resulted from it may have been due to other concomitant affections, among which pneumonia is probably the most common. Persons trying vaccination should first assure themselves that the culture they intend to use belongs to the human and not to the bovine type of the bacillus.

"Vaccination with the human type of bacillus leads to a relatively high resistance to fatal doses of the bovine bacillus.

"Vaccination with a carefully tested, attenuated bovine bacillus may be as efficacious, even in a single injection, as the double vaccination with human bacilli. Such vaccination may be less dangerous to man than when human bacilli are used.

"The immunity conferred by vaccination, as hitherto practiced, does not appear to be satisfactory as regards degree or duration. More evidence is needed with regard to these points. The herds of large public institutions are well adapted to decide these questions if vaccination is thoroughly applied, and the animals supervised by properly trained men.

"Insufficient immunity following vaccination may prove dangerous in giving rise to mild cases, after ordinary exposure in infected herds, which tend to discharge tubercle bacilli from small foci in the lungs.

"The immunity acquired by two vaccinations with human bacilli should be fortified by a subsequent injection of attenuated bovine bacilli.

"Investigations should be made looking toward the selection, by the injection of attenuated bovine bacilli, of races or breeds of cattle which possess naturally a high degree of resistance to tuberculosis. The capacity of different breeds to acquire a high degree of immunity should also be investigated.

"The survival of human and bovine bacilli in the lungs and udders of calves vaccinated intravenously with them should be more definitely determined.

"Vaccines may be easily and cheaply prepared in the form of suspensions in fluids ready for injection. The length of time during which suspensions maintain their highest efficiency remains to be determined."

The vaccination of cattle against tuberculosis, J. F. HEYMANS (*Arch. Internat. Pharmacod. et Thér.*, 17 (1907), No. 1-2, pp. 133-146; 18 (1908), No. 3-4, pp. 179-202).—Details of investigations previously noted (*E. S. R.*, 20, p. 877).

Phagocytic immunity, J. C. MEAKINS (*Jour. Expt. Med.*, 11 (1909), No. 1, pp. 100-117, charts 6).—From the experiments here described it is concluded that animals immunized with living tubercle bacilli may develop phagocytic immunity of a high degree and that such immunity may help to protect the animal from a lethal dose of virulent tubercle bacilli.

Further filtration experiments with virus of cattle plague, E. H. RUEDIGER (*Philippine Jour. Sci., B. Med. Sci.*, 3 (1908), No. 4, pp. 319-321, charts 11).—A continuation of investigations in which experiments with peritoneal fluids (*E. S. R.*, 20, p. 790) were repeated. The author concludes that peritoneal fluid retains its virulence on being passed through Berkefeld filters marked V, N, or W, but is harmless after having been passed through a Chamberland filter marked B.

Tick fever, or redwater, S. DODD (*Dept. Agr. and Stock, Vet. Div., Queensland, Bul.* 2, 1908; *Queensland Agr. Jour.*, 21 (1908), Nos. 5, pp. 245-251; 6, pp. 308-317, fig. 1; *abs. in Vet. Rec.*, 21 (1909), No. 1069, p. 438).—An account of the history, causation, symptoms, post-mortem appearance, and preventive and curative treatment of this disease, including the life history of *Margaropus (Rhipicephalus) australis*. Preventive inoculation and eradication of the ticks are considered at length.

Report on methods adopted for the eradication of cattle ticks in the United States of America, S. DODD (*Queensland Agr. Jour.*, 21 (1908), No. 1, pp. 47-51).—A summary is given of the work that has been carried on in this country up to the end of 1907.

Contributions to a biological study of *Bacillus vitulisepticus* and to the immunization of calves against septicemic pneumonia, H. SCHROEP (*Centbl. Bakt. [etc.]*, 1. Abt., Orig., 47 (1908), No. 3, pp. 307-342; *abs. in Bul. Inst. Pasteur*, 6 (1908), No. 20 pp. 917, 918).—After studying *Bacillus vitulisepticus* in different media and its pathogenic power for different species of animals, the author conducted immunization experiments. He concludes that there are many races of the bacillus since the monovalent serum protects animals against the race used in preparing the serum but only rarely against others.

The etiology of white scour in calves, C. TITZE and A. WEICHEL (*Berlin. Tierärztl. Wchnschr.*, 1908, No. 26, pp. 457, 458; *abs. in Jour. Compar. Path. and Ther.*, 21 (1908), No. 3, pp. 271-273).—In corroboration of the work of Jensen and others, the authors have found that feeding with small quantities of cultures of various kinds of bacilli produces a severe diarrhea in young calves which often ends in death. In a spontaneous outbreak of white scour, in which 5 out of 20 calves died, the authors accidentally obtained from the intestinal contents the so-called bacillus of hog cholera. The same bacillus was also found in the dung of healthy horses. In another enzootic of white scour investigated, *Bacillus enteritidis* appeared to be the cause of the diarrhea.

In order to determine the relationship that obtains between the individual varieties of typhoid bacilli found in white scour and to determine whether or not the meat poisoning bacilli play an important part, the authors examined 200 different varieties of white-scour organisms which had been isolated during numerous outbreaks of white scour occurring over almost the whole of Prussia. These were named according to their morphological and biological properties and their agglutinative effects. Of the organisms found, 151 specimens appeared to be the common *B. coli*, 28 the paracolon bacillus of Jensen, 14 the pseudocolon bacillus of Poels, 2 the *B. proteus*, and 1 the *Bacterium acidi lactici*, while 4 varieties could not be determined because they arrived in an impure state.

The authors consider it possible that the cause of white scour and of pneumonia of calves is of the nature of an ultravisible virus.

Diarrhea in calves, E. L. VALLEJO (*Estac. Agr. Cent. [Mexico] Circ.* 9, pp. 6).—A general account of the disease.

A new Indian tick, *Ornithodoros lahoriensis*, L. G. NEUMANN (*Jour. Trop. Vet. Sci.*, 3 (1908), No. 4, pp. 462-467, *figs.* 4).—This tick, taken upon sheep in India and reported to transmit a disease of sheep, is here described as new. According to the natives the tick appears to infest old sheepfolds, living in cracks and crevices and attacking sheep in November and December and the winter months. While the exact nature of the disease has not yet been determined it is said to be a pernicious anemia.

Infectious mastitis of the goat, W. R. L. BEST (*Philippine Agr. Rev. [English Ed.]*, 1 (1908), No. 8, pp. 335-337).—A general account of the symptoms and nature of this disease with prophylactic measures and remedial treatment.

Swine plague, W. JOWETT (*Jour. Compar. Path. and Ther.*, 21 (1908), No. 4, pp. 321-324).—The author here records an observation in which swine plague occurred unaccompanied by post-mortem lesions that resembled hog cholera. It is said that while hog cholera was quite prevalent in Cape Colony in 1904 it has apparently been stamped out. Post-mortem findings are reported in detail.

Cure of a stallion suffering from dourine by means of atoxyl at the remount depot at Constantine, M. MONOD (*Bul. Soc. Cent. Méd. Vét.*, 85 (1908), No. 12, pp. 303-309, *chart 1*; *Jour. Trop. Vet. Sci.*, 3 (1908), No. 4, pp. 456-461).—The author considers that it would be imprudent to conclude from a single case that atoxyl is a specific against dourine. The action of the drug, however, is said to have been well marked, though the usefulness of this stallion as a sire still remains to be determined. Given in progressive and intermittent doses atoxyl is borne well by the horse. The dog is said to be an uncertain test animal in this disease.

The agglutination test as applied to the diagnosis of glanders, K. R. COLLINS (*Am. Rpt. Dept. Health City of New York*, 1906, vol. 2, pp. 693-704).—This is a preliminary summary of investigations conducted, from which it is concluded that at present the value of the test lies in its use as an indicator for the mallein test. A later report has already been noted (*U. S. R.*, 20, p. 879).

What should each dog owner know? T. RITT (*Was muss jeder Hundebesitzer wissen?* Stuttgart, 1908, pp. VIII+112, pl. 1, figs. 21).—The aim of this work is to inform dog owners concerning their duties in order to prevent dogs from spreading diseases and parasites injurious to man and domesticated animals. Instructions are given concerning the care and management of dogs, with brief descriptions of diseases which may be transmitted by them. There is also a digest of the laws and police ordinances relating to dogs in Germany, Austria, and Switzerland.

A contribution to the study of follicular mange in the dog. N. ALMOND (*Vet. Rec.*, 21 (1909), No. 1069, pp. 428-430).—A 2.5 per cent solution of zinc chlorid in water has been used with success by the author in treating this disease in dogs. Applications were made with a sponge at night and in the morning.

Contributions to the morphology and life history of *Piroplasma canis*. A. BREINL and E. HINDLE (*Ann. Trop. Med. and Par.*, 2 (1908), No. 3, pp. 233-248, pls. 4; abs. in *Bul. Inst. Pasteur*, 6 (1908), No. 20, pp. 909, 910, figs. 5).—The studies here reported were made with a strain sufficiently virulent to kill all the dogs infected. In regard to the flagellate forms the authors report as follows: "Very rarely true small flagellate forms were seen, especially in blood from the lung; but we were never able to trace the origin of the single flagellum. . . . We have been able to trace the development of large biflagellate forms from the normal intracellular parasite. . . . These observations appear to point to the fact that the biflagellate forms of *P. canis* represent a very transient stage in its life history."

The development of *Piroplasma canis* in culture, G. H. F. NUTTALL and G. S. GRAHAM-SMITH (*Parasitology*, 1 (1908), No. 3, pp. 243-260, pl. 1, fig. 1).—The details are presented of studies made by the authors of the development of *P. canis* in vitro.

The mode of multiplication of *Piroplasma bovis*, *P. pitheci* in the circulating blood compared with that of *P. canis*, with notes on other species of *Piroplasma*, G. H. F. NUTTALL and G. S. GRAHAM-SMITH (*Parasitology*, 1 (1908), No. 2, pp. 134-142, pl. 1, dgms. 4; abs. in *Bul. Inst. Pasteur*, 6 (1908), No. 20, pp. 910, 911).—"In stained preparations *P. canis*, *P. bovis*, and *P. pitheci* may be distinguished from other intracorpuseular parasites by the presence of intracorpuseular pyriform bodies, usually occurring in pairs and less commonly in fours, eights, and sixteens. These pyriform bodies show a dense mass of chromatin near the pointed end and a loose mass, often connected with the dense mass, situated toward the blunt end. In suitable preparations peculiar dividing forms, most typically represented by trilobed forms or more or less pyriform bodies joined to a single smaller rounded or elongated mass of protoplasm, may be seen.

"In the absence of observations on the living parasite we consider that these points may be taken as characteristic of the genus *Piroplasma*.

"In spite of the fact that dividing forms have not yet been found and that the secondary mass of chromatin has not yet been observed *P. muris* may perhaps be included in this genus.

"*P. quadrigemium*, an intracorpuseular parasite recently observed by Nicolle in a small North African rodent (*Ctenodactylus gundi*), apparently divides in a totally different manner, and shows a peculiar disposition of the chromatin. No loose chromatin has been observed. Until further observations have been made this parasite can not be included among the true *Piroplasma*.

"Further observations are needed before the position of the other so-called *Piroplasma* can be determined."

Observations on the piroplasmosis of cattle in Indo-China, and proof of piroplasmosis among buffaloes, H. SCHEIN (*Ann. Inst. Pasteur*, 22 (1908), No. 12, pp. 1005-1011, figs 17, dgm. 1).—The author has studied the forms of piroplasma found in the blood of cattle in Indo-China, and here presents the results of several observations in detail. The bigeminal pear-shaped form was less frequently met with than the bacillary and ovoid forms. The pear-shaped form only appears at the height of the disease, namely, from the seventh to the tenth day after inoculation. Occasionally animals were met with which only showed the bacillary form.

In buffaloes examined the ovoid form was more frequently found than the bacillary, while the pear-shaped form was not discovered.

A new microbe pathogenic in cats, Z. SKRZYŃSKI (*Ann. Inst. Pasteur*, 22 (1908), No. 8, pp. 682-688; *abs. in Bul. Inst. Pasteur*, 6 (1908), No. 20, p. 916).—A new microbe that belongs to the *Bacillus coli* group was isolated from a disease epizootic in cats.

Investigations of epithelioma contagiosum of fowls, B. LIPSCHÜTZ (*Centbl. Bakt. [etc.]*, 1 Abt., Orig., 46 (1908), No. 7, pp. 609-622; *abs. in Bul. Inst. Pasteur*, 6 (1908), No. 16, pp. 745, 746).—This is a contribution from the Pasteur Institute at Paris, in which the author reports microscopical studies, culture and immunization experiments, and investigations made of the influence of substances on the virus.

The micrococci are stained by the methods of Löffler and Giemsa and feebly by Ziehl's stain. A 10 per cent solution of atoxyl did not attenuate the virus in vitro. Exposed to a 1 per cent solution of saponin for 1 hour the virus was not affected, but after 24 hours it appeared attenuated. A 10 per cent solution of sodium taurochlorate destroyed the virulence of the virus (in a concentrated medium) in 2 hours. The virus was not cultivated artificially. It was found present in the internal organs and also within the brain of diseased and recovered pigeons.

Culture in vitro of the fowl plague virus, E. MARCHOUX (*Compt. Rend. Acad. Sci. [Paris]*, 147 (1908), No. 6, pp. 357-359; *abs. in Bul. Inst. Pasteur*, 6 (1908), No. 20, p. 904).—The author has obtained 10 transplantations in which one-fifth of 1 cc. of the virus was sufficiently virulent to kill a fowl in 2 days.

Spirochetosis of fowls in South Oran. Transmission of this disease by *Argas persicus*, E. BRUMPT and FOLEY (*Compt. Rend. Soc. Biol. [Paris]*, 65 (1908), No. 26, pp. 132-134; *abs. in Bul. Inst. Pasteur*, 6 (1908), No. 21, pp. 964, 965). Experiments are here reported which show the incubation period of spirochetosis of fowls to be about 6½ days, and that at Beni-Ounif about 1 in every 6 of the Argasids are infected. The spirochaetes transmitted by *A. persicus* are identical with the *Spirochæta gallinarum* discovered by Marchoux and Salimbeni in Brazil.

The air-sac mite, L. V. NATHAN (*Jour. Dept. Agr. West. Aust.*, 17 (1908), No. 5, pp. 853-856, fig. 1).—The author reports this mite (*Cyrtodites nudus*) as the source of a disease that is "decimating the poultry yards of the gold fields" in western Australia. He has also observed the disease in birds in South Australia.

Epizootic pneumo-pericarditis in the turkey, W. JOWITT (*Jour. Compar. Path. and Ther.*, 21 (1908), No. 4, pp. 324-330, figs. 2; *Agr. Jour. Cape Good Hope*, 34 (1909), No. 1, pp. 42-45).—This disease, said to have been first described by McFadyen in England, is reported by the writer as having occurred in a large flock near Capetown, South Africa. Inoculations and post mortem examinations are reported and the causal organism is described. In the out-

break reported fowls, geese, and pigeons were in close contact with diseased turkeys but were not affected.

**Notes on ostrich parasites, W. ROBERTSON** (*Agr. Jour. Cape Good Hope*, 33 (1908), No. 5, pp. 583-588, figs. 6).—The ostrich tapeworm (*Tenia struthionis*) and the wireworm (*Strongylus douglasii*) are here described. A species closely related to the guinea worm of man is also mentioned.

**The cestodes of birds, O. FUHRMANN** (*Zool. Jahrb., 1908, Sup. 10, No. 1, pp. 232*).—A monograph based upon museum and private European collections. From 544 species of birds 495 cestode parasites are recorded. These parasites are shown to be of great importance in zoogeographic investigations. In the faunistic section a list is given of the hosts, with their distribution and cestode parasites.

An alphabetical index is given of the families, genera, and species. The last 20 pages are devoted to a bibliography.

**Note on the behavior of Spirochætæ in Acanthia lectularia, G. H. F. NUTTALL** (*Parasitology*, 1 (1908), No. 2, pp. 143-151).—The experiments reported "show that *Spirochæta duttoni* retains its virulence after a sojourn of 5 or more days in the intestine of *Acanthia lectularia* when the insect is maintained at a temperature of 12° C. Living (motile) spirochetes were observed in the gut-contents of the bugs up to 6 days at 12°, but only up to 6 hours at 20 to 24°. The observations made at various temperatures appear to indicate that the spirochetes are simply digested by the bug and that their more rapid disappearance from the insect's gut at higher temperatures is dependent upon the insect's digesting its food more rapidly when kept warm. . . . Although the bug is not the true host of *S. duttoni* it is conceivable that it may serve as a mechanical carrier of the parasite. . . .

"The foregoing experiments, whilst not sufficiently numerous to permit of any final conclusions, appear to indicate that *S. obermeieri* may die out more rapidly than *S. duttoni* in the gut of the bug. It is possible that the bugs digested their food more rapidly owing to their being more hungry than the lot used for experiments with *S. duttoni*.

"It has been demonstrated by one experiment that *A. lectularia* fed on an infected mouse and immediately afterwards upon a healthy mouse is capable of transmitting the spirochete."

**Leucocytozoon musculi**, a parasitic protozoon from the blood of white mice, **ANNIE PORTER** (*Proc. Zool. Soc. London*, 1908, III, pp. 703-716, pl. 1, fig. 1).—Studies of a microscopic organism found in the leucocytes of mice. This the author considers the first recorded from the mouse.

**A monozoic cestode-like blood parasite (Saguinicola armata and inermis), MARIANNE PLEHN** (*Zool. Anz.*, 33 (1908), No. 13, pp. 427-440, figs. 6).—This parasite occurs in the blood system of Cyprinid fishes.

**Helminthological technique, M. LANGERON** (*Arch. Par.*, 12 (1908), No. 1, pp. 150-154; *abs. in Jour. Trop. Vet. Sci.*, 3 (1908), No. 4, pp. 495-498).—Directions are given for the fixing, staining, mounting, and preservation of cestodes, trematodes, and nematodes, and the eggs of these parasites. The formulas of the reagents used are included.

## RURAL ENGINEERING.

**Irrigated lands of United States, Canada, and Mexico, C. R. PRICE** (*Los Angeles, Cal.*, 1908, pp. 71, figs. 17, maps 4).—This is a compilation of data concerning public and private irrigation enterprises with descriptions of the irrigated lands and the surrounding conditions. Its aim is stated to be to furnish comprehensive information to "expert, engineer, colonist, or homeseeker." In

the pamphlet is a synopsis of the Federal laws relating to the preemption of lands and it includes information published by the Department of the Interior of interest to colonist or homeseeker.

[Irrigation investigations in California], F. W. ROEDING (*Rpt. State Engin. Cal.*, 1907-8, pp. 153-156).—A brief review of the cooperative work of the irrigation investigations of this Office and the State of California.

[Irrigation in Madras Presidency], P. F. MARTIN (*Engineer [London]*, 107 (1909), No. 2770, 109, 110).—An account is given of the projects being undertaken by the British Government, in one of which it is proposed to erect the largest dam in the world. The proposed works are described, with figures as to drainage areas, reservoir capacities, dimensions of structures, and estimates of cost.

Mechanical irrigation stations on the Nile, J. B. VAN BRUSSEL (*Engin. Mag.*, 36 (1909), No. 5, pp. 749-764, figs. 17).—In this article there is described a plant located at Wadi-Kom-Ombo in upper Egypt, which will make use of part of the additional water of the Nile stored up by the Assuan Barrage. The area to be irrigated covers 150,000 acres of land where the crops will be absolutely dependent on the pumps. Reliability was therefore a prime consideration, and the pumps had to be of the centrifugal type because of the large amount of silt in the water of the Nile.

The mechanical equipment comprises centrifugal pumps with 2-meter suction pipes, operated by horizontal 4-cylinder, triple-expansion engines, and also a steel canal 5,200 feet long, nearly semicircular in cross section. By the use of a fuel economizer an increase in efficiency of 5 per cent will be obtained. Further data regarding the pumps and engines and the methods employed in the construction of the canal are given in the article.

Tidal power, W. C. HORNSNAILL (*Engineer [London]*, 107 (1909), Nos. 2774, pp. 214-226, figs. 7; 2775, pp. 233, 234, figs. 3).—In the first of these articles the writer considers the factors involved in utilizing tidal power, with a mathematical discussion as to the amount of power available from a given rise and fall and as to the efficiency of tide mills, with examples of developments.

A discussion of the economy of tidal power as compared with that of steam or gas is given in the second article, showing it to be too low to compete with them at the present value of coal.

Third Biennial Report State Engineer, North Dakota (*Bienn. Rpt. State Engin. N. Dak.*, 3 (1907-8), pp. 77, pls. 3, dgm. 1).—In this are contained reports of drainage projects, preliminary surveys of irrigation projects, accounts of hydrographic surveys of several important rivers of the State, with data and a discussion of the relation between rainfall and stream flow in the State. There is also an account of the progress being made under the various irrigation projects being carried on.

Peat levees, N. ELLERY (*Rpt. State Engin. Cal.*, 1907-8, pp. 88-92).—The writer makes recommendations as to construction and maintenance of peat levees. Among the recommendations are planting willows on the berm and up the outside slope, as it is believed that by doing this the roots will interlace the soil so as to give it increased resistance to water pressure.

The automatic water finder (*Impl. and Mach. Rev.*, 34 (1908), No. 406, p. 1238, fig. 1).—The instrument here described is reported to have been successfully used for locating underground water courses. It is stated that the operation of the instrument is based upon the measurement of electric currents constantly flowing between the earth and atmosphere. These are strongest in the vicinity of subterranean flowing waters, the strength being indicated by the deflection of a needle.

Road improvement in the United States (*Good Roads Mag., n. ser., 19* (1909), No. 3, pp. 85-91, figs. 7).—This is a compilation of brief reports submitted from about one-half of the States, showing the progress made during 1908 and the prospects for 1909.

Superheated-steam plowing machine (*Maschinen Ztg., 6* (1908), No. 23, pp. 267-270, figs. 5).—This is a description of a plowing machine using superheated steam, which is meeting with considerable success in Germany. Greater power with less water and coal consumption than with the ordinary steam engine is claimed for it. By an attachment so placed that the hottest gases as they leave the fire box pass through the tubes a superheat of 300° C. is obtained. The arrangement of the pipes and connections is explained and illustrated in the article.

In addition to the superheating arrangement this locomotive embodies many other novel features.

New milking machine systems, R. GEORGS (*Maschinen Ztg., 7* (1909), No. 3, pp. 26-31, figs. 3).—The evolution of the milking machine and the difficulties encountered in its practical application are discussed briefly. There follows a description of the principles and construction of two new types of machines, with an account of experience with them.

Machine milking and its practical application, G. ELLBRECHT (*Melkeritid., 21* (1908), No. 50, pp. 996-1004).—A general discussion of the subject, with descriptions of a number of milking machines, among them being several new types.

Milking machines (*Norsk Landmandsblad, 27* (1908), No. 41, pp. 503-506, figs. 3).—Special mention is made of two Swedish machines, with illustrations of both in operation.

Ventilation of poultry houses, K. J. J. MACKENZIE and E. J. RUSSELL (*Trans. Highland and Agr. Soc. Scot., 5. ser., 20* (1908), pp. 87-100, figs. 3).—Experiments with different types of poultry houses showed that in the presence of 6 to 8 parts of carbonic acid per 10,000 volumes of air the birds were apparently healthy. Nine volumes is believed to be the maximum content that a poultry house should contain. In order that this degree of purity may be obtained each bird must be allowed 40 cu. ft. of air per hour. In building a poultry house each bird should be allowed 10 cu. ft. of space and there should be top ventilation.

## RURAL ECONOMICS.

Cyclopedia of American agriculture. Farm and community, L. H. BAILEY ET AL. (*New York, 1909, vol. 4, pp. XIV+650, pls. 25, figs. 163*).—This is the last of the series of volumes devoted to agriculture in the United States and Canada, the other volumes having been previously noted (E. S. R., 20, p. 778).

This volume contains 10 chapters which treat, respectively, of the agricultural wealth of North America, the historical evolution of North American agriculture, including a list of current agricultural periodicals, phases of the agricultural shift, the natural resources of agriculture, land and labor, business organization in agriculture, social and service associations, education by means of agriculture, governmental and legal aid and control, and biographies of persons who have aided in the development of agriculture in North America.

The articles under the different chapters have been prepared by specialists, and particular attention is given to the bearing of the agricultural industry on the economic and social welfare of communities. Bibliographies are appended to many of the articles.

The influence of immigration on agricultural development, J. L. COULTER (*Ann. Amer. Acad. Polit. and Soc. Sci.*, 33 (1909), No. 2, pp. 373-379).—This article discusses the advantages, both to agricultural wealth production and to the economic welfare of the laborers, of the proper location of farm immigrants in parts of the country which conform as nearly as possible in physical environment, agricultural methods, and crops produced to their native lands. The results of such settlements by Swiss, Bohemians, Poles, Russians, Italians, etc., in different parts of the country are briefly discussed with reference to agriculture as a whole, to such particular branches of the industry as cheese making, and to the farm labor problem in the United States.

The Italian as an agricultural laborer, A. PECORINI (*Ann. Amer. Acad. Polit. and Soc. Sci.*, 33 (1909), No. 2, pp. 380-390).—This article presents data on the number of Italians and the branches of the agricultural industry in which they are engaged in New York, Connecticut, Massachusetts, New Jersey, Pennsylvania, North and South Carolina, Ohio, Louisiana, Arkansas, Alabama, Texas, and California. Truck farming and the raising of cotton, sugar cane, tobacco, rice, and fruits are their principal lines of work. The best results are said to be attained when the Italian owns his land or is a tenant, "but decidedly he is not adapted to be exploited as a day laborer under the peonage system."

The Jewish Agricultural and Industrial Aid Society, A. JARETZKI ET AL. (*Jewish Agr. and Indus. Aid Soc. Ann. Rpt. 1908*, pp. 58).—This is the annual report for the year 1908. The purpose of this society is to assist, encourage, and instruct Jewish farmers engaged in agriculture. At the close of the year there were 2,409 farmers occupying 2,164 farms, and this is believed to represent only about 50 per cent of the number of Jewish farmers in the United States. The loans granted and the educational and other features of the society for encouraging agriculture are presented in detail.

Concerning settlements of farm laborers in East Prussia (*Illus. Landw. Ztg.*, 29 (1909), No. 10, pp. 82, 83).—This article discusses the purposes of agricultural labor settlements and the conditions which lead to success. Among the latter are mentioned the profitableness of agriculture, the fertility of the land, and the capability of the farm laborer. The development of the laborer into an independent farmer, it is believed, rests upon the last factor more than on any other, and it is thought that this has not been sufficiently considered by those who have advocated the establishment of small holdings as a solution of the agricultural labor problem in Prussia.

Concerning settlements of farm laborers, DAVERHUTH ET AL. (*Illus. Landw. Ztg.*, 29 (1909), No. 14, pp. 123, 124).—These two articles discuss the ineffectiveness of land settlements to solve the farm labor problem in Germany. The authors contend from observations and experience that the regular farm hand on the average farm is better off than the small holder in agricultural colonies working for himself.

The land and the landless, G. CADBURY, Jr., and T. BRYAN (*London, 1908*, pp. VIII+182, *dgms.* 2).—This is a history of the agrarian problem in England with particular reference to the economic and social status of farmers and farm laborers, in which it is suggested "that the rural problem will not be solved by settling a large number of men on small farms, but that it is also necessary to set up in rural England such conditions of life and industry as shall make small farms permanently possible." The conditions which will make for success are, the authors believe, to increase the size of small holdings to from 20 to 60 acres, a sound system of furnishing capital, cooperation among

farmers, subsidiary industries to small holdings, afforestation, and a graded and better system of agricultural education.

An extensive bibliography is appended.

Small holdings and the law of April 10, 1908 (*Jour. Agr. Prat., n. ser.*, 17 (1909), No. 7, p. 202).—A brief discussion of the chief features of the law (E. S. R., 20, p. 191), which provides for the use of government funds not exceeding 100,000,000 francs (about \$20,000,000) at 2 per cent interest, in its bearing on the economic and social welfare of the owners of small farms in France.

Provisions of cottages and allotments in France (*Jour. Bd. Agr. [London]*, 15 (1909), No. 11, pp. 863, 864).—Notes are given on the more important features of the law of April 10, 1908, relating to government assistance to farm laborers for the purchase, improvement, control, and disposition of small holdings.

A small holders' Utopia, H. BEAUMONT (*Farm and Garden*, 10 (1909), Nos. 489, p. 134; 490, p. 151).—This is a brief history of the South Lincolnshire Small Holdings Association since 1886. Some of the features of the work which have proved successful are common pasturage, the erection of cottages, and copartnership farms. The beneficial results on the economic and social welfare of the tenants and their families are particularly emphasized.

Cooperative societies for the purchase of farming requisites (*Jour. Bd. Agr. [London]*, 15 (1909), No. 12, pp. 917-924; *Country Life [London]*, 25 (1909), No. 637, p. 398).—An account of the organization, objects, membership, and business transactions of cooperative societies in Great Britain.

Report of the Irish Agricultural Organization Society, Limited, H. PLUNKETT and R. A. ANDERSON (*Rpt. Irish Agr. Organ. Soc. 1908*, pp. 105).—Detailed statistical data and discussions of the work of the affiliated cooperative organizations for the year ended June 30, 1908, are given. The societies numbered 941, as compared with 873 in 1907 (E. S. R., 20, p. 289), of which 299 were cooperative creameries, 270 mutual credit societies, and 174 agricultural organizations.

Statistics of agricultural associations in 1907 (*Bul. Admin. Agr. [Brussels]*, 2 (1909), No. 2, pp. 15-64, maps 4).—Complete returns of agricultural cooperative associations in Belgium on December 31, 1907, are reported, discussed, and illustrated.

The societies are grouped into agricultural business associations of various kinds, numbering 1,271; organizations for the purchase of seeds, fertilizers, feeding stuffs, and machinery, which numbered 1,024; societies for the sale of milk and the manufacture and sale of butter and cheese, numbering 497 in active operation; agricultural credit societies, which numbered 543, and societies insuring live stock, of which there were 1,023.

Agricultural associations in Portugal, L. DE CASTRO (*Bul. Soc. Nat. Agr. France*, 68 (1908), No. 10, pp. 782-788).—Data are presented regarding the population and agricultural conditions of Portugal (E. S. R., 20, p. 587), and a brief history is given of agricultural cooperative associations from 1297 to the present time. Portugal has only about 100 associations, but government interest in them is shown by the fact that the parliament recently passed a law authorizing the use of 25,000,000 francs (about \$5,000,000) for the promotion of agricultural credit.

Danish agriculture in 1908, II. HERTTEL (*Tidsskr. Landökonomi*, 1909, No. 4, pp. 1-42).—This is the annual summary of the general conditions of Danish agriculture for the year 1908.

Norwegian agriculture in 1908 (*Norsk Landmandsblad*, 28 (1909), No. 1, pp. 1-10).—A general survey.

## AGRICULTURAL EDUCATION.

The farmer's chance to grow intellectually in his business, J. W. COOK (*Ann. Rpt. Ill. Farmers' Inst.*, 13 (1908), pp. 234-245).—The central thought of this address is that scientific interest is the characteristic of the age and that the farmer is at the center of "the scientific situation." Only work is educative, and the farmer's work is more educative than that of any other industrial laborer because of its freedom from meaningless repetition. The farm must become a school if its resources are to be transmitted unimpaired to later generations. "Education for social efficiency is the modern watchword."

**Studies in the history of modern education**, C. O. HOYT (*New York, Boston, Chicago*, 1908, pp. 223, pls. 7, maps 3, figs. 2).—This book presents certain fundamental facts in the history of education, with suggestions for their discussion, questions to invite thought and encourage research, and directions for assisting such research. It is preeminently designed as a college text, but contains a good bibliography of reference works for the general reader. The chapter headings name the representative educators and the epochs for which each stands. The term agricultural education does not appear in the index of the volume, nor is it mentioned in the single reference made to industrial training. Nor is allusion made to the American system of land-grant colleges.

**Education**, F. A. NICHOLSON (*Note on Agriculture in Japan. Madras*, 1907, pp. 77-91).—This article, which forms a part of a treatise previously noted (*E. S. R.*, 20, p. 892), includes brief accounts of and statistical data concerning science and agriculture in primary schools in Japan, supplementary (continuation) schools, regular agricultural schools, higher agricultural education, education in forestry, farm schools, private schools, itinerant teaching, support of schools, and results and cost of ordinary agricultural education.

**The beginnings of college history**, M. F. DICKINSON (*Boston*, 1908, pp. 17).—This address, delivered on the occasion of the fortieth anniversary of the founding of the Massachusetts Agricultural College, presents a very interesting review of the movements which led to the establishment of that institution.

**The educational organization of nature study**, MARY P. ANDERSON (*Jour. N. Y. Bot. Gard.*, 10 (1909), No. 111, pp. 56-63).—Attention is called to the modern viewpoint as to the proper subject-matter for nature-study work, i. e., its relation to the life of the child.

The June-bug is not studied merely as an example of the beetles, but is approached through the fat white grub that is responsible for the patches of dead grass in our lawn. The star-fish no longer gets its interest for the child as a classic example of the radiates, but from the fact that it also eats oysters. The child is not ready for the scientific classification attempted in early nature-study programmes; he is the center of his own universe, which must be explored in gradually-widening circles.

The author suggests home and its immediate surroundings, home geography, and industrial geography, as the important centers of activity for the first 5 grades.

**Nature study by grades**, H. H. CUMMINGS (*New York, Cincinnati, Chicago*, 1908, pp. 180, figs. 44).—This book is the outgrowth of a series of exercises prepared for training teachers in the Utah State Normal School, but is applicable to general nature study. An important feature is the graded arrangement of topics (for the first three grades) on a plan which insures against useless repetition.

**An elementary study of corn**, V. M. SHORSMITH (*Agr. Col. Ed. Bul. [Ohio State Univ.]*, 4 (1909), No. 8, pp. 16, figs. 13).—The writer has included in this

bulletin data for a serviceable public school manual on the selection and study of seed-corn.

The house fly as a carrier of disease, W. L. UNDERWOOD (*Hampton Leaflets, n. ser., 5 (1909), No. 3, pp. 8, figs. 2*).—This leaflet deals with the house fly as a carrier of disease. It contains a reproduction of a fly's footprints on a plate of jelly as shown by the colonies of bacteria which developed from them in 12 hours.

Illinois Arbor and Bird Days, F. G. BLAIR (*Springfield, Ill.: Dept. Pub. Instr., 1909, pp. 95, figs. 64*).—This bulletin is unusually well illustrated with half-tone engravings of fruit and flowering trees, vines, palms, ferns, house and garden plants, and all the common birds of the State. The economic value of birds is fully explained, and a chapter is given to the propagation and distribution of game birds by the State.

Wisconsin Arbor and Bird Day annual, 1909, O. S. RICE (*Madison, Wis.: State Supt. of Pub. Instr., 1909, pp. 120, pls. 6, figs. 14*).—In addition to other matter, this contains 6 colored plates illustrating the rose-breasted grosbeak, black and white creeping warbler, American sparrow hawk, barn swallow, screech owl, and horned lark.

Elements of Philippine Agriculture, E. B. COPELAND (*Yonkers-on-Hudson, N. Y., and Manila, 1908, pp. XV+192, figs. 126*).—This text on elementary agriculture, designed for the island schools, deals with the subject from the standpoint of the native agricultural soils, plants, and insects, but includes maize and several other crops that are common to America. Among those peculiar to the region may be mentioned the jack-fruit, papaya, taro, ampalaya, abacá, mangosteen, atis, and chico. The book includes directions for school gardens, experiments, plant records, and the use of tools, and is illustrated to show the contrast between primitive Philippine implements and methods and the most modern developments, such as the steam plow and grain thrasher.

A practical arithmetic, F. L. STEVENS, T. BUTLER, and MRS. F. L. STEVENS (*New York, 1908, pp. IX+386*).—This arithmetic is distinguished by the large proportion of agricultural problems, these forming probably 75 per cent of the whole number given. They convey, mostly by implication, a large amount of information on seed selection, judicious use of fertilizers, balancing of animal rations, crop rotation, prevention or treatment of plant diseases, conservation of soil moisture and soil fertility, prevention of insect injury, methods of harvesting, dairying and herd improvement, poultry culture, good roads, etc.

### MISCELLANEOUS.

The importance of scientific experimentation in agriculture, J. SCHROEDER (*7. Cong. Rural An. [Uruguay], 1908, pp. 31-60, figs. 7*).—A paper presented at the Seventh Annual Rural Congress of Uruguay. Some of the beneficial results secured from systematic agricultural experimentation in other countries are pointed out and a plea is made for the development of such work in Uruguay.

Preliminary report of the Territorial Conservation Commission of Hawaii (*Hawaii. Forester and Agr., 5 (1908), No. 12, pp. 334-347*).—This report includes a summary of data as to the nature and present condition of the natural resources of the Territory, with recommendations as to their development and use.

Conservation of Hawaii's natural resources (*Honolulu: Bd. Comrs. Agr. and Forestry, 1909, pp. 21*).—This consists of the addresses before the Territorial legislature March 1, 1909, by the governor and his conferees who attended the governors' conference with the President in Washington, D. C., in May, 1908, and by others.

Twenty months of the administration of the minister of agriculture, E. R. MEXIA (*Veinte Meses de Administración en el Ministerio de Agricultura, Buenos Ayres, 1908, pp. 297*).—This is a report of the minister of agriculture of Argentina for the 20 months ending with October, 1907.

Report of the department of agriculture of Finland, 1905 (*Landtbr. Styr. Meddel, 1907, No. 55, pp. X+218*).—The usual reports on the agricultural conditions of the year are given, together with data as to the work of the various agricultural, educational, and research institutions for the advancement of agriculture.

Report of the department of agriculture of Sweden, 1906, M. VON FEILITZEN ET AL. (*K. Landtbr. Styr. Underdåniga Ber. 1906, pp. [VI]+504+VII*).—The report contains the usual accounts of the various agencies for the promotion of Swedish agriculture, with reports of the work of the agricultural and other schools, and the chemical and seed control stations during the year.

Report of the Third Scandinavian Agricultural Congress, Christiania, 1907, H. TVETER (*Beretning om den 3 die Nordiske Landbrugskongres i Kristiania 1907. Christiania, 1908, vols. 1, pp. 170; 2, pp. 674*).—Volume 1 contains the transactions of the congress, with reports of the discussions following the reading of the papers, which are given in full in volume 2.

The agricultural service and laboratories of Indo-China (*Bul. Écon. Indo-Chine, n. ser., 11 (1908), No. 70, pp. 1-33*).—A detailed description of the organization and work of the Indo-China agricultural service, including the Bureau of Agriculture, inspection and control work, and experiment stations.

The work of the minister of agriculture, industry, and commerce through the public library, V. STRINGHER (*L'Opera del Ministero d'Agricoltura, Industria e Commercio per le Biblioteche Popolari. Rome: Govt., 1909, pp. 45; Bol. Uffic. Min. Agr., Indus. e Com. [Rome], 7 (1908), VI, No. 7-8, pp. 721-760*).—An address presented at the First National Public Library Congress, held at Rome, December 6-9, 1908. An account of the organization of agricultural circulating libraries is presented, together with the regulations adopted and catalogues of the books sent out by the various organizations engaged in this work.

The traveling instructor in agriculture and the public library, E. FILENT (*Bol. Quind. Soc. Agr. Ital., 14 (1909), No. 3, pp. 101-107*).—An address delivered at the above congress in which the use of circulating libraries in extension work is discussed.

General index to volumes 26-40 of *Centralblatt für Bakteriologie, Parasitenkunde und Infektionskrankheiten, Erste Abteilung: Medizinisch-hygienische Bakteriologie und tierische Parasitenkunde*, G. LINDAU (*Jena, 1908, pp. 429*).—This contains an author index, a subject index, and an index of illustrations to these volumes.

General index to volumes 11-20 of *Centralblatt für Bakteriologie, Parasitenkunde und Infektionskrankheiten, Zweite Abteilung: Allgemeine, landwirtschaftlich-technologische Bakteriologie, Gärungsphysiologie und Pflanzenpathologie*, K. TARTZ (*Jena, 1908, pp. 246*).—This contains an author index, a subject index, and an index of illustrations to these volumes.

## NOTES.

---

**Connecticut State Station.**—Dr. E. M. East, who has been in charge of the work in plant breeding, has accepted an assistant professorship in Harvard University, where his time will be exclusively occupied in research in plant breeding. His resignation takes effect September 1.

**Idaho University and Station.**—E. E. Elliott, dean of the college of agriculture, has been appointed director of the station.

**Maryland Station.**—C. W. Melick has resigned as dairy husbandman to accept a position as bacteriologist with a dairy concern in Omaha, Nebr., his resignation becoming effective September 1. A. L. Stabler, a 1909 graduate of the college, has been appointed assistant in animal husbandry in connection with the investigations with hogs and sheep.

**New Mexico College and Station.**—J. H. Squires, Ph. D., who has been engaged in graduate work at Cornell University for the past two years, has been appointed associate professor of agriculture, and will enter upon his duties at once. He will also be connected with the station.

**Cornell University and Station.**—Dean Bailey has been given leave of absence for the ensuing academic year, during which time Dr. H. J. Webber will serve as acting dean and director. G. W. Cavanaugh, H. H. Whetzel, E. O. Fippin, G. F. Warren, W. A. Stocking, jr., and G. N. Lauman have been promoted from assistant professorships to professorships. Other recent appointments include as assistant professors, G. W. Herrick, recently of the Texas College and Station, in economic entomology, C. R. Crosby in entomological investigations, A. W. Gilbert, Ph. D. (Cornell, 1909), and H. H. Love in plant breeding investigations, Donald Reddick in plant pathology, J. G. Needham in limnology and general biology, H. E. Ross in dairy industry, and H. W. Riley in farm mechanics; as instructor, K. C. Livermore in farm crops; and as assistants, F. S. Harris in soil technology, Robert Matheson in entomology, W. S. Lyon in poultry investigations, A. T. Moir in poultry husbandry, and L. B. Cook in dairy industry.

A series of farm barns and greenhouses is being erected.

**Office of Experiment Stations.**—L. W. Fetzer, Ph. D., assistant chemist of the Maryland Station, has accepted a position on the editorial staff of *Experiment Station Record*, to have charge of the work in agricultural chemistry. He will enter upon his new duties about September 1. J. M. Stedman, entomologist of the Missouri University and Station, has been appointed assistant farmers' institute specialist beginning May 21. F. W. Howe, instructor in agriculture at the Michigan College and of long experience as teacher and principal of public schools in Michigan, has been appointed assistant in agricultural education, and has entered upon his duties.

**The Automobile in Agriculture.**—It is announced in *La Moto-Culture*, a new monthly journal devoted to the agricultural motor and its applications, that the First International Congress of the Agricultural Automobile and the Application of Mechanical Motors in Agriculture will be held at Amiens, France, July 22 and 23, 1909, in connection with the Second International Exposition of the Agricultural Automobile and the Agricultural Motor. The address of the general secretary is 166 Boulevard de Magenta, Paris.

## INDEX OF NAMES.

# EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, PH. D., *Assistant Director.*

Assistant Editor: H. L. KNIGHT.

## EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. BEAL.  
Agricultural Botany and Vegetable Pathology—W. H. EVANS, Ph. D.  
Field Crops—J. I. SCHULTE.  
Horticulture and Forestry—E. J. GLASSON.  
Zootechny and Human Nutrition—C. F. LANGWORTHY, Ph. D.  
Agrotechny, Dairy Farming, and Dairying—R. D. MILNER.  
Agricultural Chemistry—W. H. BEAL, C. F. LANGWORTHY, and R. D. MILNER.  
Economic Zoology, Entomology, and Veterinary Medicine—E. V. WILCOX, Ph. D.  
Rural Engineering—  
Rural Economics—J. B. MORMAN.  
Agricultural Education—D. J. CROSBY.

## CONTENTS OF VOL. XX, NO. 1.

	Page.
Editorial notes:	
The continued demand for men .....	1
The standard for experiment station workers .....	4
The training for investigation .....	5
Recent work in agricultural science .....	8
Notes .....	94

## SUBJECT LIST OF ABSTRACTS.

### AGRICULTURAL CHEMISTRY.

The reactions of phthaleins and their salts, Acree .....	8
Note on the determination of potash by the perchlorate method, Schenke.....	8
On the use of nitron for the determination of nitric acid, Litzendorff.....	8
The determination of ammonia in water, Ronchese .....	9
The determination of very small amounts of carbon in water, Popowsky .....	9
A new reaction for protein, Bardach.....	9
Application of Folin's method to meats and extracts, Emmett and Grindley..	9
Concerning Liebig's meat extract, III, Kutscher .....	9
A trial of the polariscopic method for determination of gliadin, Shaw .....	10
On the analytical estimation of gliadin, Mathewson.....	10
Barfoed's solution as a means of distinguishing glucose, Hinkel and Sherman..	10
The estimation of starch in potatoes by means of specific gravity, Foth .....	10
Determining the water which flour will absorb, Hoffmann and Ploetz.....	10
Microscopical examination of wheat flour, Bellier .....	11
Adulteration of chocolate with potato starch, Paladino-Blandini.....	11
Concerning the acid content of honey, Utz.....	11
Concerning the mineral matter in honey, Utz.....	11
Concerning the mineral matter in honey, Schwarz.....	11
Biological method for determining the presence of horse meat, Weidanz.....	11
A practical method for the detection of beef fat in lard, Emery .....	11
Application to solid fats of Renard's test for peanut oil, Smith .....	12
The determination of sulphites in wine, Mensio .....	12
Examining and judging pepper, Härtel and Will.....	12

	Page.
Ginger and extract of ginger, Reich .....	12
The examination of marzipan and marzipan goods, Härtel and Hase .....	12
A simple mechanical method for the estimation of casein in cows' milk, Hart .....	12
Application of reductase test in judging milk, Barthel .....	12
A very simple means of distinguishing between cooked and raw milk, Gaucher .....	13
Pentoses in feces and their estimation, Jolles .....	13
Miscellaneous chemical analyses, Woll and Olson .....	13
New apparatus for determining condensing power of soils for ammonia, Rösing .....	13
Determination of heat of combustion of organic compounds by use of platinum resistance thermometer, Fischer and Wrede .....	13

## METEOROLOGY—WATER.

Note on some meteorological uses of the polariscope, Bell .....	13
Equivalent temperatures as a unit expression, Knoche and Hann .....	13
The relation of meteorology to horticulture, Curtis .....	14
The development of the German weather service during 1907, Börnstein .....	14
The weather of the summer of 1907 in Germany and its influence on the German agricultural industry, Kassner and Hillmann .....	14
Climate [of Belgium] .....	14
Contributions to the study of the meteorology of Cape Verde, de Macedo .....	14
Studies on the climate of Tunis, Ginestous .....	14
The climate of São Paulo, Brazil, de Souza Reis .....	14
Lakes and forests as climatic factors, Schubert .....	14
A new theory of formation of underground water, Martinet .....	14
Iron in subterranean waters, Schwes .....	14
Water supply investigations in Alaska, 1906-7, Henshaw and Covert .....	14
Nitrates, nitrites, and ammonia in sea water, Ringer and Klingen .....	15
The fertilizing value of snow, Shutt .....	15
On the purification of peaty waters by freezing, Shutt .....	15
On natural filtration of soils, Prausnitz .....	15

## SOILS—FERTILIZERS.

Preliminary report on the agricultural geology of Nebraska, Condra and Keyser .....	15
Drainage conditions in Wisconsin, Whitson and Jones .....	15
The required capacity of open drainage ditches, Jones .....	15
Some field studies in tile drainage, Jones and Schroeder .....	15
Studies on some soils from Saskatchewan, Clark, Gortner, and Vail .....	16
Soil surveys and agricultural maps in foreign countries, Rördam .....	16
Twenty-five years' work of the German Moor Culture Association, Wangenheim and Fleischer .....	16
The Swedish Moor Culture Association and the Flahult moors, Grandean .....	16
First principles of soil fertility, Vivian .....	16
The productiveness of the soil: Chemical factors, Graftiau .....	16
The influence of various salt solutions on the permeability of soils, Hissink .....	16
Nitrogen content of soils as affected by methods of farming, Whitson et al. ....	16
The feeding of plants by the nitrogen-fixing bacteria of the soil, Koch et al. ....	17
On fixation of nitrogen in cultivated soils, Warmbold .....	17
Fixation of nitrogen by certain hyphomycetes living in dead plants, Froehlich .....	17
Adaptability of sources of energy to assimilation of nitrogen, Pringsheim .....	18
The fixation of nitrogen by <i>Rhizobium leguminosarum</i> , Greig-Smith .....	18
The fixation of nitrogen by <i>Azotobacter chroococcum</i> , Greig-Smith .....	18
Biological method for determination of alkali carbonates in soils, Christensen .....	19
The new nitragin, Vogel .....	19
Inoculation as a factor in growing alfalfa, Harding and Wilson .....	19
Alfalfa aided by soil inoculation, Hall .....	19
How to determine the fertilizer requirements of Ohio soils, Thorne .....	20
Report on cooperative field experiments in Jutland, 1906 .....	20
Cooperative fertilizer trials in Malmöhus County, 1906, Weibull et al. ....	20
The value of the Albert plant food salts for pot cultures, Brehmer .....	21
Further experiments with various kinds of nitrate, Sebelien .....	21
Lime nitrogen applied at seeding and used as top-dressing in spring, Stutzer .....	21
Citric-acid-soluble phosphoric acid in phosphatic slags, de Molinari and Ligot .....	21
Comparative tests of Thomas slag and agricultural phosphate, Kuhnert .....	21
On the fertilizing value of salts of manganese, Grandean .....	22
The American fertilizer handbook .....	22

	Page.
Fertilizer materials market.....	22
Nitrate of soda in 1907, Maizières.....	22
Nitrate of soda.....	22
Agricultural uses of crude ammonia, Bouant.....	22
Influence of plant constituents on the properties of peat, Zailer and Wilk.....	22
The nitrification of peat in artificial niter beds, Desprez.....	23
Report on trials of machinery used in the peat industry, 1906.....	23
The utilization of atmospheric nitrogen, Giovanni.....	23
The high-tension arc and the fixation of nitrogen, Brion.....	24
Experimental investigations on the high-tension arc, Brion.....	24
The manufacture of calcium cyanamid, Kershaw.....	24
The action of sulphuric acid on calcium cyanamid, Jona.....	24
Other uses for lime, Pardy.....	24
The German potash industry, Kubierschky.....	24
The manufacture of potash in North Caucasus.....	24
Phosphate beds [of South Carolina], Sloan.....	25
The phosphate minerals from Elder Rock, Mawson, and Cooke.....	25
Phosphatic slags, Marsais.....	25
Phosphatic fertilizers, Fasoli.....	25
On the reversion of phosphoric acid in superphosphates, Herbst.....	25
The world's production of phosphates in 1907, Maizières.....	26
[South Carolina] marl, Sloan.....	26
Commercial fertilizers, Jones, jr., Haworth, and Proulx.....	26
Commercial fertilizers, Hills and Jones.....	26

## AGRICULTURAL BOTANY.

The occurrence of rennet in the Papaveraceæ, Gerber.....	26
Presence of a nitrate-reducing enzyme in green plants, Irving and Hankinson..	26
Rôle played by proteins and the decomposition products of albuminoids in fermentation, Ehrlich.....	27
The rôle and function of mineral salts in the life of the plant, Deleano.....	27
The possible rôle of light in relation to Alpine plants, Shaw.....	27
The carbon assimilation of <i>Penicillium</i> , Hasselbring.....	28
Assimilation of zinc by <i>Sterigmatocystis nigra</i> , Javillier.....	28
Injury to vegetation and animal life by smelter wastes, Haywood.....	28

## FIELD CROPS.

Studies on improvement of sand, marsh, and heavy clay soils, Whitson et al..	29
Relation of orchard cover crops to moisture and freezing, Delwiche and Moore..	30
The improvement of mountain meadows, Cotton.....	31
Building up a run-down cotton plantation, Brodie.....	31
Small farms in the corn belt, Warren.....	31
Annual report of Porto Rico Experiment Station for 1907 [Field crops], May..	32
Experiments with grain and forage plants, 1907, Moore, Stone, and Delwiche..	32
Cooperative alfalfa work for 1908, Williams and Goddard.....	33
Barley culture in the northern Great Plains, Carleton.....	33
Brewing barleys, Norgord.....	34
The prickly pear as a farm crop, Griffiths.....	34
The soy bean, Williams.....	34
Effect of soil inoculation on soy beans, Woll and Olson.....	34
[Fertilizer experiments with sugar beets during 1906], Woll and Stoddart.....	35
[Fertilizer experiments with sugar beets during 1907], Woll and Moore.....	35
Sweet potatoes, Beattie.....	35
Tobacco investigations for 1907, Moore and Rogers.....	35
Eradication of farm weeds, Moore, Stone, and Hutton.....	36
Report of the agronomist, East.....	36
Corn breeding in Minnesota, Bull.....	38
Plant breeding for farmers, Webber.....	38
Cereal production of Europe, Rutter.....	38
European grain trade, Rutter.....	38

## HORTICULTURE.

Report of the horticulturist, Iorns.....	38
Influence of "bottom heat" in forcing cucumbers, Moore.....	40

	Page.
Cranberry investigations, Whitson and Malde .....	40
Relation of weather to the setting of fruit; with blooming data, Hedrick.....	41
Pruning fruit trees, Thornber.....	42
Notes on the avocado fruit, Loew.....	42
Dry-land olive culture in northern Africa, Kearney.....	42
The decay of oranges while in transit from California, Powell et al.....	43
Nomenclature of the pear; a catalogue-index of the known varieties, Ragan...	44
Report of the coffee expert, Van Leenhoff .....	45
The fermentation of cacao and of coffee, Loew.....	45

## FORESTRY.

Forests .....	46
Yearbook of the administration of government and funds property, Heidler...	46
A statistical review of the forest administration of Baden for 1905.....	46
Progress report of forest administration in Baluchistan for 1905-6, Singh.....	46
Trees and their life histories, Groom.....	46
The commercial forest trees of Massachusetts, Clark .....	47
Forestry from a commercial standpoint, Rane .....	47
Practical results in basket willow culture, Mell .....	47
Yield tables for the spruce and beech of Switzerland, Flury.....	47
Progress in chestnut pole preservation, Weiss.....	48
Experiments with railway cross-ties, Eastman.....	48
Forest products of the United States, 1906.....	49
Wood pulp in Norway, Johnson.....	49
Resinous products of Dipterocarpaceæ of Indo-China, Milliau and Crevost...	49
Bamboo as raw material, Raitt .....	50
Rubber cultivation in the British Empire, Wright.....	50
Caoutchouc and gutta plants, Jumelle.....	50
India-rubber and its manufacture, Terry .....	50

## DISEASES OF PLANTS.

Report of the botanist for 1907, Clinton .....	51
Symptoms of disease in plants, Heald.....	51
The control of plant diseases, Whetzel and Stewart .....	52
Cultures of Uredineæ in 1907, Arthur.....	52
The life history of <i>Puccinia malvacearum</i> , Dandeno.....	52
Blindness in barley.....	52
Barley smut investigations, Moore and Stone .....	53
Observations upon the prevalence of early potato blight in Wisconsin, Milward...	53
Potato spraying experiments for 1907, Milward.....	53
Diseases affecting rice in Louisiana, Fulton.....	53
[Fermentation and diseases of tobacco], Loew.....	54
Peach leaf curl, Evans .....	55
Notes on the black knot of plum, Dandeno.....	55
Gooseberry black knot .....	55
Combined treatment for prevention of powdery and downy mildew, Donon...	55
Timber fungi, with special reference to the pines, Bates.....	56
The treatment of damping off in coniferous seedlings, Spaulding .....	56
<i>Fomes pinicola</i> and its host plants, Pennington.....	57
Some diseases of rubber plants, Bernard .....	57
Fungicides, Whetzel and Wilson .....	57

## ECONOMIC ZOOLOGY—ENTOMOLOGY.

Report on rabbit branch, Crawford.....	57
Observations on the food of a number of birds, Passerini and Cecconi.....	57
The locust-destroying birds of the Transvaal, d'Evelyn .....	57
Some observations concerning the effects of freezing on insect larvae, Hine...	57
The more important insects injurious to Indian agriculture, Lefroy .....	57
The Indian surface caterpillars of the genus <i>Agrotis</i> , Lefroy and Ghosh.....	57
Combating ants and locusts in South America, Bolle.....	58
European insect pests in North America, Heymons.....	58
[Insect pests], Craig, Slingerland, and Crosby.....	58
Report of the entomologist and plant pathologist, Tower.....	58
The so-called green bug and other grain aphids in Minnesota, Washburn.....	58

	Page.
Peculiar injury to barley by <i>Clorops tæniopus</i> , Wahl .....	59
Katir corn aphid .....	59
The asparagus beetles, Chittenden .....	59
Screening for the protection of cabbage seed beds, Schoene .....	59
Protecting cabbage plant beds from maggots, Hall .....	59
Insects injurious to cranberries during 1907, Hardenburg and Malde .....	59
Report on the work of the section for plant protection, 1906-7, Brick .....	60
Does it pay to spray Nebraska apple orchards? Emerson and Denny .....	60
The apple maggot or railroad worm, Quaintance .....	60
The insect pests of peach trees, Lafont .....	60
State nursery inspection, Moore .....	60
Diseases and insect pests [of coffee], Van Leenhoff .....	61
Individual and seasonal variations in <i>Helopeltis theivora</i> , Mann .....	61
The coccidæ attacking the tea plant in India and Ceylon, Green and Mann ..	61
Means of combating cockchafers, von Tubeuf .....	61
A new phytophagous mite with notes on other species, Hewitt .....	61
Experiments in the control of <i>Tinea pellionella</i> , Roussin .....	61
Bee breeding, Green .....	62
Queen rearing, Alexander .....	62
Digestibility of mulberry leaves with relation to feeding of silkworms, Bucci ..	62

## FOODS—HUMAN NUTRITION.

Food chemistry, Varges .....	62
The food chemist as an expert, Neufeld .....	62
The peacock edible, Williams .....	63
Analyses of canned sausage, Balland .....	63
Analyses of canned fish, Maljean .....	63
A new method of preserving meat, de Lapparent .....	63
Slaughtering and meat packing .....	63
Meat inspection, Toubeau .....	63
Pasteur's theory applied to diastatic action in bread making, Serand .....	63
Survival of pathogenic bacteria in bread after baking, Roussel .....	63
Studies of the flour, bread, and Italian pastes sold in Venice, Zoso .....	63
Cultivation of cassava and manufacture of flour in São Paulo, Sobrinho .....	63
Flour and grist mill products, Ellsworth .....	64
Starch, Merriam .....	64
Bacteriological studies of field-grown vegetables from Moscow, Kozyn .....	64
The soy bean as a feeding stuff in Italy, Ruata and Testoni .....	64
The nutritive value of the avocado, García .....	64
Some observations on the date, Vinson .....	64
The quantity of fatty substance in some samples of olive flesh, Passerini .....	64
Some Algerian olive oils, II, Archbutt .....	65
Composition of cocoanut milk and the diastases of <i>Cocos nucifera</i> , de Kruffyff ..	65
Adulteration of cola nut and preserved truffles .....	65
Edible oil from safflower seed, Houghton and Mudaliar .....	65
Alcohol-free beverages, Mezger .....	65
Analyses of white wines at the National School of Agriculture, Kirschbaum ..	65
Statistics of Swiss wines for the year 1906 .....	65
Port wine and the vineyards of the Alto Douro .....	65
Institutions for examination of foods in German Empire, König and Juckenack ..	65
Food inspection decisions .....	65
Food and drug inspection, Leach .....	65
Housekeeping in Egypt, Williams .....	65
How a five-cent lunch is cooked and served at Honolulu Normal School, Bell ..	66
School lunches .....	66
Vegetable products [of northern Nigeria] .....	66
Diet in Indo-China, Kermorgant .....	66
Diet of the poor and its social significance, Rubner .....	66
Hygiene in relation to nutrition and physiology, Reiss .....	66
Influence of food on experimental tuberculosis, Laune-Longue et al. ....	66
Recent dietetic experiments, Kellogg .....	67
Physiological economy in nutrition. A different explanation, Haig .....	67
Relation between uric acid and heat production, Cathcart and Leathes .....	67
Investigations on purin bodies, 1882-1906, Fischer .....	67
Has a purin free dietary any special therapeutic value? Watson ..	67
The behavior of nonfermentable carbohydrates in the animal body, Brasch ..	67

	Page.
The digestion and utilization of crude fiber and cellulose, Lohrisch .....	68
The effect of cocoa on metabolism, Gerlach .....	68
The mineral matter required by the human body, Sherman .....	68
Estimation of water vapor by the Jaquet respiration apparatus, Staehelin .....	68
Report of progress in food and nutrition, 1906-7, Langworthy .....	68

## ANIMAL PRODUCTION.

Fodders and grasses, Brunnich .....	69
<i>Salvia leuca</i> as a forage plant, Lavenir .....	69
The composition and digestibility of dried beet leaves, Honcamp et al. ....	69
Drying beet tops and use as a feeding stuff, Honcamp and Katayama .....	69
Olive pomace as a feeding stuff for farm animals, Briganti .....	69
Maizena feed and homco, Barnstein .....	69
Concentrated feeding stuffs, Cathcart, Carberry, and Gaub .....	69
Condimental stock foods, Woll .....	69
The animal body as a prime motor. Experiments with oxen, Ringelmann .....	70
Physiology of the blind intestine of Herbivora, Ustjanzew .....	70
Value of so-called plant amids in nitrogen metabolism, Henriques and Hansen ..	70
The substitution of amids for protein, Friedlaender .....	70
Protein metabolism in dogs on a low nitrogen diet, Österberg and Wolf .....	70
The nature of the urine of young calves, Langstein and Neuberg .....	70
Note on gases produced in alimentary canal of goats, Boycott and Damant .....	70
Yearbook of scientific and practical animal breeding, Müller .....	71
Live stock schemes, 1908 .....	71
The central zootechnic station at São Paulo, Raquet .....	71
Reports of live stock associations of Ontario, 1906 and 1907 .....	71
Animal husbandry in Denmark, 1906, Appel .....	71
Notes on stable ventilation, Noack .....	72
History of Shorthorn cattle, edited by Sinclair .....	72
Feeding blackstrap molasses to young calves, Woodward and Lee, jr. ....	72
Milk substitute for calf feeding, Woodward .....	72
Observations on sheep breeding, Humphrey and Kleinheinz .....	73
Notes on goat keeping, Nauckhoff .....	73
The value of different kinds of green forage for hogs, Waters .....	73
Pig fattening tests, Hinrichs .....	74
Corn to make a pound of pork, Hendricks .....	75
Meat meal for pigs as compared with ground grain, Steffens .....	75
Notes on swine management, Linklater .....	75
The portable hog house, Fuller .....	75
The horse book, Johnstone .....	75
Breeds of horses, Wrangel .....	75
Report of the department of horse breeding, Alexander .....	75
Horse raising in Denmark, 1906, Jensen .....	75
Economical horse feeding in the brewing industry .....	75
Substitutes for oats in horse feeding, König .....	75
Report on the poultry industry in Denmark and Sweden, Brown .....	75
Progressive poultry culture, Brigham .....	76
The perfected poultry of America, McGrew and Howard .....	76
Cost of feeding chickens, E. and W. Brown .....	76
The production of table poultry, Paynter .....	76
Notes on the preservation of eggs in water glass, Hendrick .....	76
Pheasant farming, Simpson .....	76

## DAIRY FARMING—DAIRYING.

The university dairy herd, 1906-7, Humphrey and Woll .....	77
Tests of dairy cows, 1906-7, Woll and Harris .....	77
Records of production made by Colantha 4th's Johanna, 1906-7, Woll .....	77
The Jerseys at the St. Louis Exposition .....	77
Bacteria of machine and hand drawn milk, Hastings and Hoffmann .....	77
Cell elements in milk and relation to sanitary standards, Russell and Hoffmann ..	78
Concerning the bactericidal property of perhydrazide milk, Much .....	78
Milk commissions and production of certified milk in United States, Lane .....	78
The variation in the composition of milk, Lauder .....	79
Variations in the amount of casein in cows' milk, Hart .....	79
The chemistry of milk curdling, Sammis .....	79

	Page.
The coagulation of fresh and alkaline milks, Sammis.....	79
Effect of autolysis on the precipitogenic character of milk, de Waele.....	80
Influence of oxygen on fermentation by typical lactic-acid bacteria, Koestler.....	80
Butter from sweet cream, Charron.....	80
Influence of metals on the action of rennet, Olson.....	80
Red spots in Emmenthal cheese, Thöni and Allemann.....	81
Investigation of Gervais cheese, Müller.....	81
Regarding "short" cheese, Boekhout and de Vries.....	81
An automatic cheese press, Moore.....	81

## VETERINARY MEDICINE.

Veterinary hygiene, Klimmer.....	81
Wounds: Their treatment and some minor surgical operations, Robertson.....	81
Preventive inoculation of farm stock, Robertson.....	82
Veterinary division, Gilruth and Reakes.....	82
Aggressins in barbone and their application as an immunizing agent, Baldrey.....	82
Granulous colpititis as a cause of sterility, Brante.....	82
A mycosis affecting man and rats, Lutz and Splendore.....	82
Cultivation of trypanosomes and vital coloration of these organisms, França.....	82
The trypanolytic power of serum in experimental nagana, Rodet and Vallet.....	82
The preventive and curative power of human serum in cases of nagana, Goebel.....	82
The treatment of experimental nagana, Loeffler and Rühs.....	83
The diagnosis of rabies, Gryuner.....	83
The etiology and diagnosis of rabies, Oreste.....	83
The effect of various chemicals upon rabies virus, Fermi.....	83
The theory and practice of anti-rabic immunization, Harvey and McKendrick.....	83
The action of bile on tetanus toxin, Vincent.....	83
Action of the component elements of the bile on tetanus toxin, Vincent.....	84
Experiments in the use of epsom salts in the treatment of tetanus, Cruveilhier.....	84
Inoculation tuberculosis in cold-blooded animals, Moriya.....	84
Fetal tuberculosis in calves, Ellerman and de Waal.....	84
Influence of wounds on localization of tuberculosis, Rodet and Jeanbrau.....	84
The action of chlorin on the tubercle bacillus, Moussu and Goupil.....	84
The formation of antibodies from the substance of the tubercle, Bertarelli.....	84
Tubercle toxin studies, II, Haentjens.....	85
Cultures of tubercle bacilli in vivo and vaccination against the disease, Moussu.....	85
Vaccination against tuberculosis, Leclainche.....	85
Tuberculosis tests for 1906-7, Russell.....	85
Extent to which milk yield is affected by injections of tuberculin, Bohm.....	85
Two new species of nematodes in alimentary tract of cattle in Sumatra, Vryburg.....	86
Parturient paresis, Wagner.....	86
Poisoning of cattle with tansy, Wessel, Wilster, and Bugge.....	86
Two undescribed diseases of sheep, Dale.....	86
The stomach worm of sheep and goats, Dixon.....	86
Ulcerous stomatitis of goats, Cadéac.....	86
Lesions in swine by <i>Echinorhynchus gigas</i> , Weinberg and Romanovitch.....	87
Swine erysipelas, Césari.....	87
Occurrence of the bacilli of swine erysipelas in healthy hogs, Pitt.....	87
Behavior of white blood corpuscles in common diseases of the horse, Franke.....	87
The behavior of red blood corpuscles in surgical diseases of the horse, Gasse.....	87
Studies on glanders, Galtier.....	88
The toxin of glanders bacillus, Turró.....	88
Abscess formation in horses affected with glanders, Lienaux.....	88
Combating glanders in Dutch East Indies, Van der Burg.....	88
A study of the toxin in ulcerous lymphangitis of the horse, Dassonville.....	88
The treatment of mange in dogs, Dietz.....	88
<i>Piroplasma canis</i> and its life cycle in the tick, Christophers.....	88
[A bacterial growth on chickens], May.....	88
The persistence of contagion of fowl cholera, Sizov.....	89
Spirochetosis of Indian fowls— an after phase, Balfour.....	89
Some observations on swollen head in turkeys, Graham-Smith.....	89

## RURAL ECONOMICS.

Piecework in agriculture, Wasmuth.....	89
The farm labor problem in the Empire State.....	89

	Page.
Emigration to Virginia and the labor question, Koiner.....	89
The Hungarian farm labor problem.....	90
The agricultural holdings act, 1906, Poley.....	90
The creation of small holdings under the act of 1907, Wilkins.....	90
Cooperative movement relating to grain industry in United States, Rudloff.....	90
Agricultural mutual societies, Léraillé.....	90
The Utopia of agricultural credit, Oestreicher.....	91
[Cooperative societies in Bombay Presidency], Campbell and Jukes.....	91
Summary of the work of the agricultural commission during 1907.....	91
The agricultural budget for 1908, Martin.....	91
Crop Reporter.....	91
Agricultural production in Russia in 1906.....	91
Agricultural statistics of Bengal for 1906-7.....	91
Manual of world economics, edited by von Halle.....	91
Bibliography of the price of cereals, Mackenzie and Baines.....	92

## AGRICULTURAL EDUCATION.

Course in agriculture, McCreedy.....	92
State facilities for viticultural instruction in Hungary, Wortmann.....	92
French traveling agricultural domestic science schools, Ducloux.....	92
The teaching of agriculture, James.....	92
Agriculture in public schools, Dewitt.....	92
Public school cookery, is it playing fair with the home and taxpayer? Hartt.....	92
School gardening, Latter.....	93
School gardening at Greenville, Ohio, Rowe.....	93
Arbor day—the American spring festival, Lee.....	93
The farm boys' encampment, Jordan.....	93
Proceedings of spring meeting of State Board of Agriculture, Martin.....	93
Bird life: Its relations to the farmer, Scheffer.....	93
The story of cotton, Breen.....	93
Notes on drainage, Jones.....	94

## MISCELLANEOUS.

Annual Report of Porto Rico Station, 1907.....	94
Twenty-fourth Annual Report of Wisconsin Station, 1907.....	94
Laws applicable to the United States Department of Agriculture.....	94
The conservation of natural resources, Pinchot.....	94

# LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

<i>Stations in the United States.</i>		<i>U. S. Department of Agriculture.</i>	
	Page.		Page.
Connecticut State Station:		Farmers' Bul. 324 .....	35
Bien. Rpt. 1907-8, pt. 6 .....	51	Farmers' Bul. 325 .....	31
Bien. Rpt. 1907-8, pt. 7 .....	36	Farmers' Bul. 326 .....	31
Indiana Station:		Farmers' Bul. 327 .....	94
Bul. 125, Apr., 1908 .....	26	Food Insp. Decisions 93-96 .....	65
Louisiana Stations:		Bureau of Animal Industry:	
Bul. 104, Mar., 1908 .....	72	Bul. 104 (10 cents) .....	78
Bul. 105, Apr., 1908 .....	53	Circ. 132 .....	11
Minnesota Station:		Bureau of Chemistry:	
Bul. 107, Mar., 1908 .....	38	Bul. 113 (10 cents) .....	28
Bul. 108, Apr., 1908 .....	58	Bureau of Entomology:	
Missouri Station:		Circ. 101 .....	60
Bul. 79, Mar., 1908 .....	73	Circ. 102 .....	59
Nebraska Station:		Forest Service:	
Bul. 106, May 2, 1908 .....	60	Bul. 77 (15 cents) .....	49
New Jersey Stations:		Circ. 146 .....	48
Bul. 212, Apr. 8, 1908 .....	69	Circ. 147 .....	48
New York Cornell Station:		Circ. 148 .....	47
Bul. 251, Feb., 1908 .....	38	Bureau of Plant Industry:	
Bul. 252, Mar., 1908 .....	52, 57, 58	Bul. 123 (20 cents) .....	43
New York State Station:		Bul. 124 (10 cents) .....	34
Bul. 299, Mar., 1908 .....	41	Bul. 125 (10 cents) .....	42
Bul. 300, Mar., 1908 .....	19	Bul. 126 (30 cents) .....	44
Bul. 301, Mar., 1908 .....	59	Bul. 127 (10 cents) .....	31
Ohio Station:		Circ. 4 .....	56
Circ. 78, Mar. 25, 1908 .....	34	Circ. 5 .....	33
Circ. 79, Apr. 15, 1908 .....	20	Bureau of Statistics:	
Circ. 80, 1908 .....	33	Bul. 68 (15 cents) .....	38
Porto Rico Station:		Bul. 69 (10 cents) .....	38
An. Rpt., 1907 .....	37,	Crop Reporter, vol. 10, No. 7,	
38, 42, 45, 54, 58, 61, 88, 94		July, 1908 .....	91
Vermont Station:		Office of the Solicitor:	
Bul. 134, Mar., 1908 .....	26	[Pub.] (25 cents paper; \$1.00	
Washington Station:		canvas) .....	94
Popular Bul. 3, Feb., 1908 .....	42		
Popular Bul. 4, Mar., 1908 .....	75		
Wisconsin Station:			
Twenty-fourth An. Rpt., 1907 .....	12, 13,		
15, 16, 29, 30, 32, 34, 35,			
36, 40, 53, 59, 60, 69, 73,			
75, 77, 79, 80, 81, 85, 94			

NOTE.—The publications of the United States Department of Agriculture, except those of the Weather Bureau, may be purchased from the Superintendent of Documents, Washington, D. C. For the publications of the Weather Bureau requests and remittances should be directed to the Chief of the Bureau. The price of *Experiment Station Record* is \$1.50 per volume, or 15 cents per number. The prices of other technical publications are given above. The publications of the State experiment stations are distributed from the stations and not from the Department.

# EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, PH. D., *Assistant Director.*  
Assistant Editor: H. L. KNIGHT.

## EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. BEAL.  
Agricultural Botany and Vegetable Pathology—W. H. EVANS, Ph. D.  
Field Crops—J. I. SCHULTE.  
Horticulture and Forestry—E. J. GLASSON.  
Zootechny and Human Nutrition—C. F. LANGWORTHY, Ph. D.  
Agrotechny, Dairy Farming, and Dairying—R. D. MILNER.  
Agricultural Chemistry—W. H. BEAL, C. F. LANGWORTHY, and R. D. MILNER.  
Economic Zoology, Entomology, and Veterinary Medicine—E. V. WILCOX, Ph. D.  
Rural Engineering—  
Rural Economics—J. B. MORMAN.  
Agricultural Education—D. J. CROSBY.

## CONTENTS OF VOL. XX, NO. 2.

	Page.
Editorial notes:	
The work of moor land experiment stations .....	101
The field of the insular experiment stations .....	105
The experiment station in Guam .....	107
Recent work in agricultural science .....	109
Notes .....	196

## SUBJECT LIST OF ABSTRACTS.

### AGRICULTURAL CHEMISTRY.

Joint recommendations of the committees on protein nomenclature .....	109
A suggestion for a new unit of energy, Armsby .....	109
A supposedly new compound from wheat oil, Gortner .....	109
Physical and chemical properties of the fat of the common chestnut, Paladino .....	109
Rotatory power of alcoholic extracts of cereal proteids, Lindet and Ammann .....	109
The relation between refraction and iodine value in pork fat, Halpaa .....	109
Preparing odorless fatty acids from fish oil, Sandberg .....	110
Hydrolyzing and oxidizing bacteria of fat, de Kruyff .....	110
Contribution to study of composition of starch grains, Gatin-Gruzewska .....	110
Concerning the composition of the starch grain, Gatin-Gruzewska .....	110
Note on vegetable phosphatids, II, Winterstein and Hiestand .....	110
The formation of aldehyde or ketone in acetic fermentation, Farnsteiner .....	110
The action of anilin colors on diastase and pepsin, Sato .....	110
Coloring matter in apple juice, Kulisch .....	110
The determination of carbon, Pouget and Chouchak .....	111
Determination of phosphoric acid, Pawlenko .....	111
Alkalimetric estimation of phosphoric acid by Neumann's method, Gregersen .....	111
Determination of free sulphuric acid in superphosphates, Pomaski .....	111
Methods and apparatus for nitrogen and phosphoric acid in fertilizers, Rousset .....	111
The determination of hardness and carbon dioxid in waters, Noli .....	111
Practical treatise on the analysis of foods, Gérard and Bonn .....	112

	Page.
Analytical methods and communications regarding food materials, etc.....	112
Micrographical examination of meat powder, Peltriset.....	112
The estimation of boric acid in liquid eggs, Parkes.....	112
The Burstert method of determining fat in cheese, Mühlbach.....	112
Method for the complete analysis of vegetable products, Albahary.....	112
The estimation of starch in maize, Frank-Kamenetzky.....	112
Official analysis of Russian high-grade sugars.....	113
Concerning the Marpmann reaction for honey, Utz.....	113
The detection of cherry juice in raspberry juice, Jonscher.....	113
Examination of white wine colored with parched chicory, Popescu.....	113
Ester estimation in wine, Austerweil and Pacottet.....	113
Lactic acid in wine, Paris.....	113
The precipitation method for the estimation of oils, Howard.....	113
The quantitative estimation of total sulphur in urine, Schulz.....	113
The methods of analysis of raw rubber, Spence.....	113
Miscellaneous analysis, Hartwell.....	113
Modification of the Soxhlet extractor, Wood, jr.....	113

## METEOROLOGY—WATER.

Precipitation, run-off, and evaporation on the earth's surface, Fritzsche.....	114
Kinds and distribution of viable micro-organisms in atmosphere, Flemming..	114
Monthly Weather Review.....	114
Meteorological work [of the Alaska Stations], Georgeson.....	115
Climate of Kansas, Jennings.....	115
Meteorological observations at the Massachusetts Station, Ostrander et al....	115
Meteorological observations.....	115
Report of meteorologist, Helme.....	115
Weather of the year 1907 in Switzerland, Billwiller.....	115
Meteorological observations in Surinam and Curaçao, 1907.....	115
The climate of the British Isles, Watt.....	115
Climate of the Bahama Islands, Fassig.....	115
Forests and rainfall, Henry.....	116
The level of underground water in forests and in the open, Ototzky.....	116
The level of subsoil waters with regard to forest, Pearson.....	116
Changes of methods in water resources work of Geological Survey, Hoyt.....	116
Effect of low temperature on bacteria in ice, Sparks.....	116
Sewage purification works of the State Agricultural School, Minnesota, Bass..	116

## SOILS—FERTILIZERS.

Soil studies, II: Acid soils, Blair and Macy.....	116
Some notes on soil acidity, Morse and Curry.....	117
A natural model for the formation of dunes, Günther.....	117
Washington soils, Thatcher.....	117
Summary of the soil survey of the State, Thatcher.....	118
Analyses of soils [of grass lands], Taylor.....	118
Humid and arid soils of Rio Verde, Garcia Oses.....	118
The origin of the fertile soils of western Morocco, Gentil.....	118
Notes on Egyptian and Soudan soils, Hughes.....	118
Contribution to the knowledge of the lands and agriculture of Syria, Auhagen..	119
Soils [of the Malay States] and their analysis, Bamber.....	119
Classification of soils, Rebello da Silva.....	119
The nomenclature of soils, Pardo y Urbina.....	119
Physiography for high schools, Salisbury.....	119
Land ruin compared with soil improvement, Hopkins.....	119
On the deep cultivation of soils, Strecker.....	119
Methods of soil toxicology, Schreiner and Shorey.....	120
The cause of soil sickness.....	120
Bacteriological investigations with reference to the drying of soils, Rahn.....	120
Influence of composition of medium upon solvent action of soil bacteria, Brown..	120
On the activity of bacteria in soils, Vogel.....	121
Atmospheric nitrogen, Woolcock.....	121
Bacteria inoculation in the culture of leguminous plants, Simon.....	121
The assimilation of free nitrogen by micro-organisms, Bofillanger.....	121
Note on de Rossi's article on organisms which produce tubercles, Peretti.....	121

	Page.
Contribution to the knowledge of denitrification processes, Kühl .....	121
The construction of manure pits and the preservation of manure, Cornelius...	121
Plans for the construction of manure pits, Friz.....	122
Demonstration experiments with fertilizers in Carinthia, Svoboda .....	122
Experiments with fertilizers on sandy soils in bad cultivation, Clausen.....	122
Influence of fertilizers on the composition of wheat, Snyder.....	122
On nitrogenous fertilizers and their application, Lavenir .....	122
Nitrate-as soil renovators, Schreiner and Reed.....	122
Nitrogen capacity of soils with fertilization with nitrate of soda, Pfeiffer.....	122
Lime nitrogen and nitrogen lime, II, Löhnis and Sabaschnikoff.....	123
Investigations on lime nitrogen and nitrogen lime, Löhnis and Sabaschnikoff.....	123
Experiments with new nitrogenous fertilizers, Malpeaux.....	124
Experiments with calcium cyanamid, Hall.....	124
Nitrolime, Ragondet.....	124
Effect of addition of sodium to deficient amounts of potassium, Hartwell et al.....	124
The partial substitution of potassium by sodium as a plant food, Hartwell et al.....	125
What is the relation of the increase in yield of barley produced by phosphatic fertilizers to the phosphoric acid content of the soil? Pilz.....	125
Phosphorus and humus in relation to Illinois soils, Hopkins.....	125
On the behavior of minerals in soils, Vinassa de Regny.....	125
Effect of lime and gypsum on the solubility of potassium, Morse and Curry....	125
Effect of lime upon availability of soil constituents, Guthrie and Cohen.....	125
Experiments with lime and crushed limestone on Pennsylvania clay loam, Frear.....	126
Relation between effects of liming, and of nutrient solutions containing different amounts of acid, upon growth of certain cereals, Hartwell and Pember.....	126
Relation between acid in nutrient solutions and liming, Hartwell and Pember.....	127
Analysis of a sample of synthetic calcium nitrate, Passerini.....	127
Tennessee white phosphate .....	127
Composition of ashes from Vesuvius, Comanducci .....	127
Kainit, Jubartre.....	127
Garbage tankage, McMurtrie.....	127
Analyses of fertilizers for consumers, Burd.....	127
Analyses of commercial fertilizers, Scovell, Curtis, and Roberts.....	127
Analyses of commercial fertilizers, Frear .....	128
Licensed commercial fertilizers, 1908, Woll and Olson.....	128

## AGRICULTURAL BOTANY.

The origin of the potato, Druery.....	128
Texas honey plants, Sanborn and Scholl.....	128
Poisonous properties of beans of <i>Phaseolus lunatus</i> , Dunstand and Henry.....	128
A quantitative study of transpiration, Clapp.....	129
Relation between size of the stomata and photosynthesis in grasses, Kolkunov.....	129
The physiological function of potash in plants, Stoklasa.....	130
The influence of light and of copper on fermentation, Purvis and Wilks.....	130
On the variation of peroxidase in seeds, Brocq-Rousseau and Gain.....	130
Studies on variegation and some accompanying phenomena, Lindemuth .....	131
Recent investigations in plant breeding, Erüwirth.....	131
Reports of the plant culture stations in Denmark, 1905-6 and 1906-7.....	131

## FIELD CROPS.

Thirty years of crop rotations on the prairie soil of Illinois, Hopkins et al.....	131
Field crops [at Copper Center Station in 1907], Heideman.....	131
[Field crops at Rampart Station in 1907], Rader.....	132
Report of the Upper Peninsula Substation for 1905 and 1906, Geismar.....	132
Forage crops in northwest Texas, Conner .....	133
Grains and forage crops for northern Wisconsin, Moore and Delwiche.....	134
Wyoming forage plants and their chemical composition, Knight et al.....	134
Alfalfa studies, Blinn.....	134
Clover seed in the Connecticut market, Jenkins and Jagger .....	135
[Experiments in clover and corn selection], Card.....	135
Egyptian cotton in the southwestern United States, Kearney and Peterson.....	135
How to make cotton growing pay, Carver.....	136
Rice investigations: Report of first year's experiments, Krauss .....	136
Topography of the sugars and nonsugars in the sugar-beet root, Urban.....	141

	Page.
Food requirements of seed beets, mother beets, and cuttings, Andrlík et al. . . .	141
An experiment in Swedish turnip culture, Card. . . . .	142

## HORTICULTURE.

[Horticultural investigations in Alaska], Georgeson et al. . . . .	142
Report of the horticulturist, Higgins . . . . .	143
Report of the South Haven Substation for 1906, Taft and Wilken . . . . .	143
[Horticultural crops of Upper Peninsula Substation], Geismar . . . . .	144
Report of the horticulturist, Garcia . . . . .	144
Report of the horticultural division, Card . . . . .	144
The cultivation and handling of goldenseal, Henkel and Klugh . . . . .	146
Marketing the muskmelon, Lloyd . . . . .	146
Notes on Brassica crosses, Sutton . . . . .	146
How new fruits can be made by crossing, Fletcher . . . . .	147
Horticultural districts of the State, Marshall et al. . . . .	147
Fall and early winter injuries to trees and shrubbery by freezing, Selby . . . . .	147
The forcing of grafted American grape stocks, Drago . . . . .	147
The tropical plants of commercial importance, de Wildeman . . . . .	148
The date sugar palm ( <i>Phoenix sylvestris</i> ), Banerjei . . . . .	148
Ether and the germination of seeds, Taubenhaus . . . . .	148
A handbook for planning and planting home grounds, Manning . . . . .	148
Laws of Massachusetts relating to public shade trees . . . . .	148

## FORESTRY.

Forest economy, Huffel . . . . .	149
State forestry development, Rane . . . . .	149
Contribution to the forest statistics of Alsace-Lorraine . . . . .	149
Forestry in the provinces of Malaga, Grenada, Jaen, and Cordova . . . . .	149
Forest administration in lower Bengal for the year 1905-6, Lovegrove . . . . .	149
Fire conservancy in Burma, Bryant . . . . .	149
Economic thinning of white pine, Hawes . . . . .	149
Condition of cut-over longleaf pine lands in Mississippi, Holmes and Foster . . . . .	150
Mexican timber, Butman . . . . .	150
Austria's wood industry and lumber trade, von Engel . . . . .	150
A treatise on the commercial uses of wood, Mathey . . . . .	151
The arboretum of the National School of Streams and Forests, Jolyet . . . . .	151
The evergreen trees of Colorado, Longyear . . . . .	151
Notes on the bamboos of Indo-China, Crevost . . . . .	151
The chestnut tree, Lavialle . . . . .	151
Karité, argan, and other African sapotaceous trees, Perrot and Chevalier . . . . .	151
Teak wood, Büsgen, Hosseus and Busse . . . . .	152
Growing wattle bark, Millward . . . . .	152
Willow culture in Holland, Hesseling . . . . .	152
An effective screen for nurseries, Zavitz . . . . .	152
The cultivation of <i>Ficus elastica</i> , Bald . . . . .	152
<i>Hevea guyanensis</i> in Surinam, Van Asbeck . . . . .	152
A new [rubber-producing] forest species of Tonquin, Eberhardt . . . . .	152
Observations on rubber-producing tree of Tonquin, Eberhardt and Bloch . . . . .	152

## DISEASES OF PLANTS.

A contribution to the biology of wood-destroying fungi, Rumbold . . . . .	153
Parasitism of <i>Melanopyrum pratense</i> , Gautier . . . . .	153
On the existence of <i>Mycomonas betæ</i> , Trzebinski . . . . .	153
A study of <i>Aspergillus flavus</i> , Brocq-Rousseu . . . . .	153
Distorted barley heads, von Hegyi . . . . .	153
Dry rot of corn, Burrill and Barrett . . . . .	153
Diseases of the peach, Foex . . . . .	154
A spot disease of potatoes, Swellengrebel . . . . .	154
A Fusarium disease of potatoes, Appel . . . . .	154
A leaf spot disease of sisal in German East Africa, Braun . . . . .	155
The smuts of sorghum, Freeman and Umberger . . . . .	155
The field treatment of tobacco root rot, Briggs . . . . .	155
The susceptibility of various varieties of wheat to smut, Kirchner . . . . .	156

	Page.
Wheat nematodes .....	156
A contribution to the knowledge of cutting bed fungi, Ruhland.....	156
A disease of globe artichokes, Trabut.....	156
A disease of lettuce due to <i>Marsonia panattoniana</i> , Appel and Laibach.....	156
[Apple diseases in Kentucky], Garman.....	157
A disease of olives due to <i>Cylindrosporium olivæ</i> n. sp., Petri.....	157
Yellows and some other important diseases of the peach, Phillips.....	157
Cacao pests of Trinidad, Barrett.....	157
Cranberry diseases in Wisconsin, Shear.....	157
Some diseases of strawberries, Laibach.....	158
A pine disease.....	158
A disease of pine twigs, Petri.....	158
Witches' brooms of <i>Pinus sylvestris</i> , Müller.....	158
Fungusine as a smut preventive, McAlpine.....	159

## ECONOMIC ZOOLOGY—ENTOMOLOGY.

Report of the ornithologist, Surface.....	159
The lizards of Pennsylvania, Surface.....	159
Studies in metazoan parasitology in McManes laboratory of pathology, Smith.....	159
The rôle of arthropods in pathology, Marotel.....	159
International catalogue of scientific literature. L—General Biology.....	159
Report of the entomologist, Van Dine.....	159
Report of the entomologist, Tryon.....	160
Report of government entomologist, 1906, Pratt.....	160
Indian insect pests, Lefroy.....	160
The life history of the carpenter ant, Pricer.....	160
An automatic trap for night-flying moths, Friedrich.....	160
The control of snout beetles on beets, Wahl and Philp.....	160
The harlequin cabbage bug, Chittenden.....	161
The insect enemies of the boll weevil, Hunter, Newell, and Pierce.....	161
Development of <i>Isosoma</i> on Agropyron, W. and J. Van Leeuwen-Reynvaan.....	161
The national collection of Coccidæ, Marlatt.....	161
<i>Aspidiotus ostreaformis</i> , Macdougall.....	161
San José scale in Oklahoma, Nicholson.....	161
Apple orchard pests in Kentucky, Garman.....	161
The codling moth in 1907, Melander and Trumble.....	161
Spraying for the codling moth, Melander.....	162
Annihilating the codling moth, Melander.....	162
Spraying for codling worm, Gossard.....	162
Eighth report of Woburn Experimental Fruit Farm, Bedford and Pickering.....	163
Spraying apple trees, Garman.....	163
Insecticides and fungicides for use in the apple orchard, Garman.....	164
Principles underlying the preparation of insecticides, Mansier.....	164
The cranberry insects of Wisconsin, Hardenberg.....	164
Treatment of grape roots for phylloxera, Faes.....	164
A revision of the Ixodoidea, or ticks, of the United States, Banks.....	164
The influence of frost on tick life, Verney.....	164
Influence of high temperatures on the eggs of the silkworm, Quajat.....	165

## FOODS—HUMAN NUTRITION.

Some present-day problems of biological chemistry, Chittenden.....	165
The occurrence of nitrates in foods, Richardson.....	165
Imported meat foods of questionable wholesomeness, Buchanan.....	165
On inquiries with regard to the wholesomeness of tripe, MacFadden.....	165
Meat clubs, Doane.....	165
Statistics of the meat consumed and imported, 1902-1906, Betancourt.....	165
Powdered eggs, Norton.....	165
Concerning crab extract, IV, Ackermann and Kutscher.....	166
The proteolytic enzymes of certain vegetable food stuffs, Aron and Klempin.....	166
Milling of wheats, Brunnich.....	166
The milling quality of Washington wheat, Thatcher.....	166
The effect of nitrogen peroxid upon wheat flour, Alway and Finckney.....	166
[Chemistry of the bleaching of flour], Avery.....	166
Studies of the cause of coloration in black bread, Bertrand and Mutermilch.....	166

	Page.
Wheat and bread, Patourel .....	166
Changes in rye flour due to molds, Arnoldow .....	166
Comparative nutritive value of bread and zwieback, Belli .....	166
The vermicelli and alimentary pastes of Annam, Crevost .....	167
Studies of fruit pulp called Nette flour, Goris and Crété .....	167
Note on fruit juice statistics, Lührig, Bohrisch, and Hepner .....	167
Grape juice cordial .....	167
Concerning alcohol-free beverages, Mezger .....	167
Cocoa from the Gold Coast .....	167
Calorimetric and analytical studies of cocoa, Langbein .....	167
Enrilo, a new coffee substitute, Beitter .....	167
Hops, Brunnich .....	167
Food analyses, Willard .....	167
Report on food products for 1907, Allen and Card .....	168
Ice cream thickeners, Patrick .....	168
Concerning the requirements of the German pure food laws, König .....	169
Food law requirements, Abel .....	169
Notices of judgment .....	169
Hygienic cookery, Calvin .....	169
The Rising Sun Household Cookery Book, La Mont and Weedon .....	169
The kitchen manual, 1907, Rees .....	169
How to cook cowpeas, Carver .....	169
Saving the wild plum crop, Carver .....	169
Measuring food values, Wilson .....	169
Metabolism experiments with 32 children 3 to 6 years old, Müller .....	169
Minimum protein requirement, Forster .....	169
A contribution to the study of calcium metabolism, Patterson .....	170
The importance of calcium salts for the growing body, Aron and Sebauser .....	170
Influence of surrounding temperature on carbon dioxid output, Ignatius et al. .....	170
Concerning the rôle of powdered meat, Lassablière .....	170
The biological significance of lecithin, I, Glikin .....	171
The rôle of osmotic pressure in the phenomena of animal life, Demoor et al. ..	171

## ANIMAL PRODUCTION.

Experiments on the digestibility of prickly pear by cattle, Hare .....	171
The composition and digestibility of hay from sewage meadows, Volhard .....	172
The hay from sewage meadows and feeding calcium phosphate, Ehrenberg .....	172
German potato flakes, Kehl .....	172
Dried grape marc as a feed for farm animals, Sémichon .....	172
"Nsa-Sana" seeds from southern Nigeria .....	172
On some by-products from ethereal oil manufacture, Honcamp and Katayama ..	172
Composition of Hawaiian feeding stuffs, Thompson .....	172
Feeding stuff inspection, Woods and Bartlett .....	172
Commercial feeding stuffs, Calvert .....	173
Licensed concentrated feeding stuffs, Woll and Olson .....	173
The digestion of different quantities of feed by swine, Katayama .....	173
Studies of nitrogen, phosphorus, and sulphur in vegetable products, Stutzer ..	173
Elimination of phosphorus by Herbivora, Gouin and Andouard .....	174
The action of fresh cola nuts on muscular work, Chevalier and Alquier .....	174
The influence of sexual function on metabolism, Tangl .....	174
The effects of environment and nutrition upon fertility, Marshall .....	174
Experiments in calf feeding, Gouin and Andouard .....	174
Skim milk for raising and fattening calves, Malpeaux .....	175
Feeding experiments with diastasolin, Reichert .....	175
Calf feeding, Strebel .....	175
Animal production in Argentina, Baldassarre .....	175
Cattle raising, Hnos .....	175
Cattle, French and foreign, Diffloth .....	175
The improvement of Egyptian cattle, Goodehild .....	175
Live and dead weight of Egyptian animals, McCall .....	175
Sugar for fattening sheep, Malpeaux .....	176
An attempt to acclimatize sheep at Kelantan .....	176
Rations for fattening hogs, McDonald and Malone .....	176
Stock food for pigs, Wilson and Skinner .....	176
Some suggestions to farmers who kill their own hogs, Schuler .....	177

	Page.
Notes on horse feeding, Vital.....	177
Feeding tests with bran molasses for horses, Pape.....	177
The feeding of the pure blood horse, Grandeau.....	177
The use of dried skim milk for feeding a pure blood horse, Peers.....	177
Proceedings of the Horse Breeding Congress, Paris, 1907, de Lagorsse.....	177
The grade stallion situation in Wisconsin, Alexander.....	178
Safety for new-laid eggs.....	178
The marketing of poultry.....	178
National standard squab book, Rice.....	178
Breeding for squabs, Sotter.....	178

## DAIRY FARMING—DAIRYING—AGROTECHNY.

Sources of bacteria in milk, Esten and Mason.....	178
Bacterial and chemical changes in milk at low temperatures, Pennington.....	179
The milk of cows afflicted with foot-and-mouth disease, Cornalba.....	180
Tests of dairy cows, 1906-7, Woll and Harris.....	180
The Kirkee civil dairy, Fletcher.....	180
The problem of the poor cow, Fraser.....	180
Why and how to test dairy cows, Fraser.....	180
Milk supply of Kentucky—Louisville, Allen.....	180
Dairy practice at Kenai Station, Ross.....	180
The origin of the turnip taste of butter, Weigmann.....	180
Rusty cans and their effect upon milk for cheesemaking, Olson.....	181
Varieties of cheese, Doane and Lawson.....	181
Investigation of commercial rennet preparations, Burr and Berberich.....	181
The position of the oleomargarine industry in Sweden, Larson.....	181
The manufacture of starch from sweet potatoes, McDonnell.....	181
The pitting or pulping of olives, Marcille.....	182
Vegetable butter, Cornalba.....	182
Extraction of beeswax, Alford.....	182
Technology of fats and oils, Hefter.....	182

## VETERINARY MEDICINE.

Therapeutic technique, Schlampp.....	182
Veterinary hygiene, Bonansea.....	183
Report of board of live-stock commissioners of Ohio, Calvert and Fischer.....	183
Report of civil veterinary department and of the Bengal college, 1906-7, Gait.....	183
Annual report of the imperial bacteriologist, 1906-7.....	183
Morphological changes in the spleen in animals passively immunized, Jarotzky.....	183
The latency of tetanus spores in the animal organism, Canfora.....	184
The mouse typhoid bacillus and the typhoid coli bacillus, Lotzer.....	184
The pathogenic effects of human viruses, Cobbett.....	184
The pathogenic effects of bovine viruses, Griffith.....	185
The infection of the organism with general tuberculosis, Pawlowsky.....	185
Morphological variation in the tubercle bacillus, Arloing.....	185
Tubercle bacilli in meat and lymphatic glands of tuberculous animals, Swierstra.....	186
Ophthalmic reaction to tuberculin, Vallée.....	186
Cerebral traumatism and the reaction to tuberculin, Slatineano and Danielopol.....	186
Immunity toward tuberculosis, Métalnikoff.....	186
A plan for eradicating animal tuberculosis, Rogers.....	186
The dissemination and control of tuberculosis in the bovine species, Moore.....	187
The diagnosis of blackleg, Warringsholz.....	187
<i>Bacilli pyogenes baris</i> and <i>sois</i> and chronic inflammation of the lungs, Berger.....	187
The occurrence and frequency of streptococcic mastitis in cows, Rühm.....	187
Tick fever in cattle, Pound.....	187
Sheep dips, Quibell.....	187
<i>Bacillus pseudotuberculosis</i> in hogs, Sérès and Guillaume.....	188
The hygiene and internal diseases of the horse, Morisot.....	188
Seborrhoeic eczema in horses, Bang.....	188
Ophthalmic reaction in glanders, Wladimiroff.....	188
Hepatic hemorrhage as a result of amyloid degeneration in horses, Noyer.....	188
The etiology of fowl plague, Prowazek.....	189
Coli septicemia in fowls as a disease during transportation, Claussen.....	189

	Page
Infectious inflammation of the air sacs in geese, Bugge.....	189
Penetration of toxins from parasitic worms into the body of the host, Weinberg.....	189
Feeding stuffs poisonous or injurious for animals, Dumont.....	189
The effect of digitalis and its glucosids upon various ruminants, Salvisberg.....	189

## RURAL ECONOMICS.

The agrarian question in the German economic system, Cronbach.....	190
The agrarian social problem in Spain, del Retamoso .....	190
[Papers relating to rural economics] .....	190
Small holdings in Hampshire, Newsham.....	190
The English peasantry and the inclosure of common fields, Slater.....	191
Some reflections upon the reassignment of small farms, Raeymaeckers.....	191
The law of April 10, 1908, relating to small holdings and cheap houses.....	191
The holdings of agricultural laborers, Convert.....	191
The opportunity of acquiring property afforded the agricultural laborer, Antoine.....	191
Mutual agricultural credit, Decharme.....	191
Mutual credit and agricultural improvement, Virgili.....	192
Agricultural credit, de Eza.....	192
Agricultural labor, Hitchins.....	192
Crop Reporter .....	192
[Agricultural statistics of the Netherlands].....	192

## AGRICULTURAL EDUCATION.

The next step in agricultural education, Davenport.....	192
The township high schools of Ohio, Graham .....	192
Instruction in practical agriculture upon the university farm at Davis.....	192
Southern agriculture, Earle.....	193
Agriculture for Southern schools, Duggar .....	193
Elements of agriculture, Welborn .....	193
Agriculture in the elementary schools, Abbey.....	193
Rural school agriculture, Davis.....	194
How agriculture can be taught in our schools, Mankenberg .....	194
Horticultural education, Close .....	194
An elementary course in horticulture for the schools of Michigan, Fletcher.....	194
The adornment of rural school surroundings, Clothier.....	194

## MISCELLANEOUS.

Annual Report of Alaska Stations, 1907.....	194
Nineteenth Annual Report of Georgia Station, 1906.....	194
Twentieth Annual Report of Georgia Station, 1907.....	195
Annual Report of Hawaii Station, 1907 .....	195
Twentieth Annual Report of Michigan Station, 1907.....	195
Eighteenth Annual Report of New Mexico Station, 1907 .....	195
Twentieth Annual Report of Rhode Island Station, 1907 .....	195
Southern California Pathological Laboratory and Citrus Station, Smith .....	195

# LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

## *Stations in the United States.*

Alabama Tuskegee Station:	Page.
Bul. 12, June, 1907 .....	169
Bul. 13, Aug., 1908 .....	169
Bul. 14, Apr., 1908 .....	137
Alaska Stations:	
An. Rpt. 1907 .....	115,
	132, 133, 142, 180, 194
California Station:	
Circ. 35, Feb., 1908 .....	195
Circ. 36, Mar., 1908 .....	127
Circ. 37, May, 1908 .....	192
Colorado Station:	
Bul. 128, Apr., 1908 .....	135
Bul. 129, May, 1908 .....	182
Bul. 130, May, 1908 .....	151
Connecticut State Station:	
Bul. 160, June, 1908 .....	136
Connecticut Storrs Station:	
Bul. 51, Apr., 1908 .....	178
Florida Station:	
Bul. 93, May, 1908 .....	116
Georgia Station:	
Nineteenth An. Rpt. 1906 .....	194
Twentieth An. Rpt. 1907 .....	195
Hawaii Station:	
An. Rpt. 1907 .....	137,
	143, 159, 172, 195
Illinois Station:	
Bul. 124, Apr., 1908 .....	146
Bul. 125, May, 1908 .....	131
Circ. 114, Jan., 1908 .....	180
Circ. 115, Jan., 1908 .....	180
Circ. 116, Feb., 1908 .....	125
Circ. 117, Apr., 1908 .....	153
Kentucky Station:	
Bul. 132, Dec. 31, 1907 .....	127
Bul. 133, Jan., 1908 .....	157,
	161, 163, 164
Bul. 134, Feb., 1908 .....	180
Maine Station:	
Bul. 156, Apr., 1908 .....	172
Massachusetts Station:	
Met. Buls. 233-234, May-June,	
1908 .....	115
Michigan Station:	
Spec. Bul. 40, Apr., 1907 .....	143
Spec. Bul. 41, Apr., 1907 .....	143, 144
Twentieth An. Rpt. 1907 .....	115, 195
Mississippi Station:	
Bul. 109, Apr., 1908 .....	194
New Mexico Station:	
Eighteenth An. Rpt. 1907 .....	144, 195
Ohio Station:	
Bul. 191, Feb., 1908 .....	162
Bul. 192, Feb., 1908 .....	147

## *Stations in the United States—Continued.*

Oklahoma Station:	Page.
Bul. 79, Apr., 1908 .....	161
Bul. 80, May, 1908 .....	176
Rhode Island Station:	
Twentieth An. Rpt. 1907 .....	113,
	115, 124, 126, 136, 142, 144, 195
South Carolina Station:	
Bul. 136, Apr., 1908 .....	181
South Dakota Station:	
Bul. 105, Feb., 1908 .....	176
Texas Station:	
Bul. 102, Jan., 1908 .....	128
Bul. 103 .....	134
Washington Station:	
Bul. 85, 1908 .....	117
Bul. 86, 1908 .....	161
Popular Bul. 5, Mar., 1908 .....	162
Popular Bul. 6, May, 1908 .....	166
Popular Bul. 7, June, 1908 .....	118
Wisconsin Station:	
Bul. 158, Mar., 1908 .....	178
Bul. 159, May, 1908 .....	164
Bul. 160, Mar., 1908 .....	180
Bul. 161, Mar., 1908 .....	135
Bul. 162, Apr., 1908 .....	181
Bul. 163, Apr., 1908 .....	128, 173
Wyoming Station:	
Bul. 76, Mar., 1908 .....	135

## *U. S. Department of Agriculture.*

Notices of Judgment 1-4 .....	169
Bureau of Animal Industry:	
Bul. 105 (10 cents) .....	181
Bul. 106 (10 cents) .....	171
Bureau of Entomology:	
Bul. 15 (tech. ser.) (15 cents) .....	164
Bul. 16, pt. 1 (tech. ser.) (5	
cents) .....	161
Circ. 103 .....	161
Forest Service:	
Circ. 149 .....	150
Bureau of Plant Industry:	
Bul. 128 (15 cents) .....	136
Circ. 6 .....	146
Circ. 7 .....	155
Circ. 8 .....	155
Bureau of Statistics:	
Crop Reporter, vol. 10, No. 8,	
Aug., 1908 .....	192
Weather Bureau:	
Monthly Weather Review, vol.	
36, Nos. 3-4, Mar.-Apr., 1908	
(20 cents per number, \$2.50	
per year) .....	114, 115

# EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, PH. D., *Assistant Director*.  
Assistant Editor: H. L. KNIGHT.

## EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. BEAL.  
Agricultural Botany and Vegetable Pathology—W. H. EVANS, Ph. D.  
Field Crops—J. I. SCHULTE.  
Horticulture and Forestry—E. J. GLASSON.  
Zootechny and Human Nutrition—C. F. LANGWORTHY, Ph. D.  
Agrotechny, Dairy Farming, and Dairying—R. D. MILNER.  
Agricultural Chemistry—W. H. BEAL, C. F. LANGWORTHY, and R. D. MILNER.  
Economic Zoology, Entomology, and Veterinary Medicine—E. V. WILCOX, Ph. D.  
Rural Engineering—  
Rural Economics—J. B. MORMAN.  
Agricultural Education—D. J. CROSBY.

## CONTENTS OF VOL. XX, NO. 3.

Editorial notes:	Page.
The status of agricultural education in England and Wales.....	201
A proposed American association of home economics .....	205
Recent work in agricultural science.....	207
Notes.....	294

## SUBJECT LIST OF ABSTRACTS.

### AGRICULTURAL CHEMISTRY.

On the quantitative volatilization of phosphoric acid, Jannasch and Jilke....	207
A study of the solubility of potassium chloroplatinate, Archibald et al.....	207
Destruction of organic matter by electricity in analysis, Scurti and Gasparini.....	207
The volumetric determination of hardness in potable waters, Milone.....	207
Direct Nesslerization of Kjeldahl digestates, Adams and Kimball.....	208
On the determination of nitrogen in gas mixtures, Lidoff.....	208
Determinations of nitric acid in arable soils, Weibull.....	208
Note on the Dyer method, Shutt and Charron.....	208
New method for quantitative determination of diastatic ferments, Wohlgenuth.....	208
The probable chemical constitution of rennet, Scala.....	209
Pepsin and rennet, Bang.....	209
Methods of determining the moisture content of butter, McKay and Bower.....	209
German and American lard, Seitter.....	209
Crystallization experiments with lard and tallow, Seitter.....	209
Concerning that portion of meat extract which can not be salted out, Micko.....	209
Extract of meat, Grieb.....	209
Methods for the analysis of vegetable foods, Alquier.....	209
A comparison of methods of estimating sugar, Kinoshita.....	210
Fehling's solution, and determining reducing sugars, Watts and Tempany.....	210
Identification of $\delta$ -fructose in the presence of other natural sugar, Pieraerts.....	210
The detection of artificial and natural honey, Fiehe.....	210
The analysis of waste molasses, Johnson.....	210
Analysis of flour.....	210
The decomposition of lecithin-phosphoric acid, Matthes and Hübner.....	210
Changes in the extractives in the determination of wine extract, Roettgen.....	210
The identification of blueberry juice in fully fermented red wine, Plahl.....	210
Determining extract in vinegar, Windisch and Schmidt.....	210
Detection of boric acid in foods, Mannich and Priess.....	211
Method for detection of fluorids in food products, Amberg and Loevenhart.....	211
The quantitative estimation of benzoic acid in catsup, LaWall and Bradshaw.....	211
The use of the microscope in the detection of food adulteration, Howard.....	211

	Page.
Determining aldehydes with the spectroscope, Bruylants.....	211
On a modification of the Schultze-Tiemann apparatus, Jacqué.....	211
General application of Christomanos carbon dioxid apparatus, Christomanos..	211
Report of the chemical division, Rose.....	211

## METEOROLOGY—WATER.

A search for fluctuations in the sun's thermal radiation, Newcomb.....	211
Anticyclones as aids to long-distance forecasts, Rawson.....	212
Bulletin of the Mount Weather Observatory.....	212
The weather of Scotland in 1907, Watt.....	212
Meteorology, Boname.....	212
Meteorological report for the year ended March 31, 1907.....	213
Map-studies of rainfall, Mill.....	213
Hygienic water supplies for farms, Bolton.....	213

## SOILS—FERTILIZERS.

Relations between climate and terrestrial deposits, Barrell.....	213
The fertility of some colonial soils, Juritz.....	214
The loss of water from soil during dry weather, Leather.....	214
The upland moor as a water distributor, Gangnus and Rosenstand-Wöldike..	214
Report on irrigation dry farming and soil moisture investigations, Nelson....	214
Humus in New Hampshire soils, Morse.....	215
Soil deterioration and soil humus, Hills, Jones, and Cutler.....	215
What the chemist has found in Pennsylvania soils, Frear.....	216
On soils derived from carboniferous limestone, Grégoire.....	216
Where crop yields are curtailed by lack of phosphoric acid and lime, Agee....	216
The composition of buntersandstein soils, Hornberger.....	216
Some representative soils, Ingle.....	216
Analyses of grain soils [of Cape of Good Hope], Juritz.....	216
The development of the modern plow in relation to soil fertility, Hugues.....	217
Natural agencies in soil improvement, Voorhees.....	217
The productiveness of the soil: Bacteriological factors, Marchal.....	217
The problem of soil bacteriology, Fischer.....	217
Microbiochemical processes of ammonization in cultivated soils, Perotti.....	217
Influence of organic matter on nitrification, Karpinski and Niklewski.....	218
On the production of carbon dioxid in cultivated soil, Marr.....	218
The action of carbon bisulphid and similar substances on the soil, Störmer....	218
A denitrification experiment, Fischer.....	218
The reduction of nitrates, Laurent.....	218
Note on dialysis of soils, Garola.....	218
The analysis of the soil by cultivated plants, Proost.....	219
A simple method of testing the manurial wants of soils.....	219
Testing soils for fertilizer needs, Taylor.....	219
The results of practical fertilizer experiments, Wagner.....	219
Increase and decrease of nitrogen in the soil by manuring.....	219
The sources of nitrogen and nitrogen fertilizing, Schneidewind.....	220
The content of combined nitrogen in the air, Vageler.....	220
The nitrogen problem in agriculture.....	220
Field experiments with different nitrogenous fertilizers, Kleberger.....	220
Norwegian and Chilean nitrate, von Feilitzen and Grandeau.....	220
Calcium cyanamid as a fertilizer, Immendorff and Kempiski.....	220
Experiments with calcium cyanamid, De Polo.....	221
Calcium nitrate and calcium cyanamid, Grandeau.....	221
A danger in the use of nitrogenous fertilizers, Cavazza and Zerbini.....	221
On the potash fertilizing of tropical and subtropical plants, Vageler.....	221
Potash fertilizers, Cavazza.....	221
Farming light soils with special reference to use of potash salts, Kitzinger....	221
Action of soil bacteria on phosphates, Sackett et al.....	221
Action of soil bacteria on phosphates, Sackett et al.....	221
On the action of agricultural phosphate, Böttcher.....	221
Fertilizer experiments with Thomas slag, Jozek.....	221
Results of cooperative experiments with fertilizers in swamp soils, Harecourt..	221
The action of lime on the bacterial life in soils, Vogel.....	221
Action of manganese and a manganiferous mineral as a fertilizer, Strampelli..	221
The use and increasing production of sulphate of ammonia, Collot.....	221
The utilization of the nitrogen of the air in Germany, Kempiski.....	221

	Page.
Utilization of atmospheric nitrogen by means of calcium and barium, Piccinini.....	223
The action of certain fertilizers on calcium cyanamid, Fascetti.....	223
On the chlorin content of kainit, De Ruijter de Wildt.....	223
Composition of Peruvian guano and its value as a fertilizer, Maschhaupt.....	223
The utilization of locusts as fertilizer, Lavenir.....	224
Mineral fertilizer, Wendel.....	224
Absorptive capacity of peat litter under pressure, Lugner and Von Feilitzen..	224
Fertilizer trade in Hawaii, Marquès.....	224
Commercial fertilizers; a quarter century of fertilizer inspection, Hills et al....	224
Mixing chemical fertilizers on the farm, Morse.....	224

## AGRICULTURAL BOTANY.

The relation of plant societies to evaporation, Transeau.....	224
Does phosphorus play a part in the production of chlorophyll? Stoklasa et al..	224
Lactic and alcoholic fermentation in plant tissues, Stoklasa.....	225
The effect of light on germination, Kinzel.....	225
Stimulating action on germination of colloidal solutions, Micheels and De Heen..	225
The ascent of water in trees, Ewart.....	225
The constancy of mutants and the origin of disease resistance in plants, Bolley..	226
The correlation of flower and fruit structure in <i>Carica papaya</i> , Wester.....	226
The nectaries of cotton, Tyler.....	226
Symbiosis in fern prothallia, Campbell.....	227

## FIELD CROPS.

Dry farming in Idaho, Nelson.....	227
Dry-land farming in the Great Plains area, Chilcott.....	227
Notes on dry farming, Jardine.....	228
Cropping systems for stock farms, Spillman.....	228
Results of cooperative experiments in agriculture, Zavitz.....	228
[Effects of manures on old land hay], Gilchrist.....	229
The botanical history and classification of alfalfa, Scofield.....	229
<i>Alopecurus agrestis</i> , Fruwirth.....	229
Period of plant food assimilation and dry matter production in bush bean, Fest..	229
Clover growing on loess and till soils of southern Iowa, Stevenson and Watson..	230
The flax plant; its cultivation for seed and fiber, Saunders.....	231
Millet, Williams.....	231
The deterioration of Red Texas oats in Kansas, Roberts and Freeman.....	231
Canadian field pea, Atkinson.....	231
Cooperative potato experiments for 1908, Green and Goddard.....	231
Rice book.....	232
The importance of sodium to the sugar beet, Andrlík and Urban.....	232
Proteid substance produced in the sugar beet during the first year, Andrlík....	232
Further studies on sugar-beet plants more than one year old, Strohmer et al..	232
Annual sugar beets, Deutsch.....	233
Growing sugar-beet seed in South Dakota, Shepard.....	233
Seedling canes and manurial experiments, D'Albuquerque and Bovell.....	233
Growing tobacco under shade on the east coast of Sumatra, Hunger.....	234
The art of seed selection and breeding, Shamel.....	234
Improvement of grasses and other forage crops, Galloway.....	235
Improvement of cereals, Perkins and Spafford.....	235
Modifications in cereal crops induced by changes in their environment, Lyon..	235
The germination of vegetable seeds, Brown and Goss.....	235
Effect of animal digestion and fermentation on vitality of seeds, Oswald.....	236

## HORTICULTURE.

Manuring and fertilizing truck crops, Close and White.....	236
Truck farming in the Atlantic Coast States, Corbett.....	237
Chile culture, Garcia.....	237
[Variety tests, at Wisley, 1906-7].....	237
Report of experimental fields in South Holland for 1907, Claassen et al.....	237
Experimental fruit stations of the Province of Quebec, Dupuis et al.....	237
Miscellaneous greenhouse notes, Close, White, and Ballard.....	238
New work of the Bureau of Plant Industry, Galloway.....	239
New hybrid fruits, Hansen.....	239
Promising new fruits, Taylor.....	239
A study of the volume-increment on fruits, Rivière.....	239

	Page.
The orchards of Maine, Hitchings .....	240
Survey and outlook of the fruit interests of the State .....	240
The status of the American lemon industry, Powell .....	240
Strawberries for New Hampshire, Hall .....	240
A study of the quality and production of several red grapes, Faes and Porchet .....	241
The sugar and acidity in the Chasselas Doré grape, Rivière and Bailhache .....	241
Forcing plants with electricity, Bos .....	241
Roses; their history, development, and cultivation, Pemberton .....	241
The bibliography of the chrysanthemum, Payne .....	241
Yard and garden, Baker .....	242

## FORESTRY.

Report of board of directors of American Forestry Association for 1907 .....	242
Report of the forestry branch, July 1, 1906, to June 20, 1907, Dalrymple-Hay .....	242
The causes of timber lines on mountains, Shaw .....	242
Cutting timber on the National Forests and providing for a future supply, Zon .....	242
Chestnut oak in the southern Appalachians, Foster and Ashe .....	243
Forest and ornamental trees on grounds of A. and M. College of Texas, Ness .....	243
The physical characteristics of the hardwoods of Australia, Julius .....	243
The use of wooden poles for overhead power transmission, Wade .....	244
Treating wood refractory to treatment and also subject to decay, Allerton .....	244
Preservation of wood against decay, Henry .....	245
The Ceara rubber tree in Hawaii, Smith and Bradford .....	245
The rubber plant of southern Europe, Mattei and Van den Kerckhove .....	246
Hints on the cultivation of Para rubber, Bartlett .....	246

## DISEASES OF PLANTS.

Notes on some plant diseases, Savastano .....	246
Fasciations of known causation, Hus .....	246
Experiments in combating plant diseases, Ravn and Madsen-Mygdal .....	246
Texas root rot of cotton: Field experiments in 1907, Shear and Miles .....	246
Hollow potatoes, Massee .....	247
On the existence of <i>Myxomonas betæ</i> , Von Faber .....	247
The distribution and control of cucurbit mildew, Köck and Kornauth .....	247
Infection experiments with cucurbit mildew, Reed .....	247
The cross-inoculation of fruit trees and shrubs with crown-gall, Hedgcock .....	248
A new cherry disease, Salmon .....	248
Recent studies of the olive-tubercle organism, Smith .....	249
Trials relating to gooseberry mildew, and its eradication, Lind and Ravn .....	249
Notes on the treatment of mildew, Degruilly .....	249
The black rot of the grape and its control, Reddick and Wilson .....	249
A disease of chestnut trees, Sangier .....	250
The possibility of control of walnut blight by use of immune varieties, Ramsey .....	250
Diseases of ornamental trees, Metcalf .....	250
Rose mildew, Prillieux .....	250
Fungicides, insecticides, and spraying directions, Stone and Fernald .....	250

## ECONOMIC ZOOLOGY—ENTOMOLOGY.

The game resources of Alaska, Osgood .....	251
Destruction of wolves and coyotes, Bailey .....	251
The rabbit as a farm and orchard pest, Lantz .....	251
Rabbits and the western flora, Peacock .....	251
Destruction of the cotton boll weevil by birds in winter, Howell .....	251
Food habits of wood pigeons, Winton .....	251
Does it pay the farmer to protect birds? Henshaw .....	252
An account of the Biological Survey, Henshaw .....	252
Index-catalogue of medical and veterinary zoology, Stiles and Hassal .....	252
Sixth report of State entomologist and plant pathologist of Virginia, Phillips .....	252
Proceedings of twentieth meeting of Association of Economic Entomologists .....	252
Thirty-eighth annual report of the Entomological Society of Ontario .....	253
Some factors influencing insect development, Hennings .....	254
Increased weight of pupæ in atmosphere with high carbon dioxide, Von Linden .....	254
Some critical observations on the European species of <i>Chermes</i> , Burdon .....	254
Intercortical scale formation and the development of <i>Diaspis fallax</i> , Morstatt .....	254
The biology of plant lice, Mordwilko .....	254

	Page.
The interrelations of ants and plant lice, Mordwilko.....	254
Polymorphism of ants, with abnormalities due to parasitism, Wheeler.....	254
The fungus-growing ants of North America, Wheeler.....	254
Wild bees, wasps, and ants, Saunders.....	254
The book of garden pests, Pearson.....	255
Practical remedies for insect pests, Lefroy.....	255
Insects injurious to seeds, Bargagli.....	255
The frit fly.....	255
The codling moth or apple worm, Quaintance.....	255
The woolly aphis of the pear tree, Passy.....	255
The scale insects of citrus trees, Howard.....	255
The San José scale, Surface.....	255
Spraying experiments for 1907, Henderson.....	256
Spraying in an off year, Denny.....	256
Lime sulphur for use against San José scale, Phillips.....	256
Dipping nursery stock in lime-sulphur wash, Parrott, Hodgkiss, and Schoene.....	256
The currant bud mite and the hazel bud mite, Macdougall.....	256
Mosquito blight of tea, Hutchinson.....	256
Thrips on cocoa, Ballou.....	257
On the structural characters of three species of Coccidæ, Newstead.....	257
Notable depredations by forest insects, Hopkins.....	257
Using various species of trees as trap trees for bark beetles, Sedlacek.....	257
Insects injurious to loco weeds, Chittenden.....	257
The value of insect parasitism to the American farmer, Webster.....	257
Fruit fly parasites, Baker.....	258
Anatomy, biology, and pathogenicity of <i>Ixodes reduvius</i> , Vorontzov.....	258
The tsetse fly in India, Lefroy.....	258
Apiculture, Chavez.....	258
Bee diseases in Massachusetts, Gates.....	258

## FOODS—HUMAN NUTRITION.

Changes taking place in chickens in cold storage, Pennington.....	258
The grades of wheat in the Manitoba inspection division, crop of 1907.....	259
The chemistry of strength of wheat flour, II, Wood.....	260
Report on the manufacture and sale of song-thân and hô-tiêu, Sandré.....	261
Hawaiian honeys.....	261
Concerning coffee, Gorter.....	262
Preparation of vinegar in relation to sale of food and drugs acts, Hamill.....	262
Fruit juice statistics, 1907, Bömer.....	262
Concerning fruit juices for the year 1907, Behre, Grosse and Thimme.....	262
Fruit statistics for the year 1907, Baier and Hasse.....	263
Concerning fruit juices and marmalades for the year 1907, Fischer and Alpers.....	263
Fruit juice statistics for the year 1907, Schwarz and Weber.....	263
Concentrated fruit juice, Röhrig.....	263
Hungarian fruit juices, Halmi.....	263
The detail of the enforcement of the Food and Drugs Act, Bigelow.....	263
The nutrition of man, Chittenden.....	263
Food and diet in the United States, Langworthy.....	264

## ANIMAL PRODUCTION.

Chemical studies of growth, I. The inverting enzymes of alimentary tract, Mendel and Mitchell.....	265
Enzymes involved in purin metabolism in the embryo, Mendel and Mitchell.....	265
The occurrence of glycogen in the embryo pig, Mendel and Leavenworth.....	266
Transformation of glycogen by enzymes of embryonic tissues, Mendel and Saiki.....	266
The autolysis of embryonic tissues, Mendel and Leavenworth.....	267
Purin, pentose, and cholesterol content of the egg, Mendel and Leavenworth.....	267
The catalase of animal embryonic tissues, Mendel and Leavenworth.....	267
The occurrence of lipase in embryonic animal tissues, Mendel and Leavenworth.....	267
Notes on the composition of embryonic tissues, Mendel and Leavenworth.....	267
The effect of drinking and salting food upon body weight, Parkas.....	268
Digestion experiments, Fraps.....	268
Silage for fattening cattle, Carmichael.....	270
Feeding experiments with molasses, Weiser and Zaitschek.....	270
The nutritive value of different sorts of screenings, Tangl and Weiser.....	271

	Page.
Concerning blood meal, Zaitschek .....	271
Kansas concentrated feeding stuffs law .....	271
The range problem in New Mexico, Wooton .....	271
Poultry work at the Maine Station, Woods .....	271
Poultry keeping for egg production, Brooks .....	272
The relative live weight of the organs in chickens, Zaitschek .....	273

## DAIRY FARMING—DAIRYING—AGROTECHNY.

Conditions affecting proportions of fat and proteins in cow's milk, Van Slyke ..	273
The reducing properties of milk, Sommerfeld .....	275
Bacteria in milk, Rogers .....	275
Bacterial associations in the souring of milk, Marshall and Farrand .....	275
Bacterial associations in the souring of milk, Marshall and Farrand .....	276
Variation in the chemical composition of butter, Crowther .....	276
On the relation between clean skimming and clean churning, Jonas .....	276
Babcock test for butter fat, Frandson .....	276
The chemical changes involved in hard cheese production, Coward .....	276
Butter, cheese, and condensed milk, Bullock .....	277
Dairying industry .....	277
Report of dairy test associations of Östergötland County, 1906-7, Westman ..	277
Milk records, Speir .....	277
Milk and butter tests at the Lincoln show, 1907, Mathews .....	277
Fat in milk .....	277
Dairy supervision branch .....	277
Official laboratory of the Province of Quebec, Tourchot .....	277
Report of the dairy institution at Memmingen, 1907, Teichert .....	277
Investigations on dairy science and practice in 1907, II. semester, Raudnitz ..	277
Milking machines, Lindström .....	278
Vinification, Pacottet .....	278
The technical manufacture of chemically pure levulose, Stein .....	278

## VETERINARY MEDICINE.

Proceedings of the American Veterinary Medical Association .....	278
Report and recommendations regarding veterinary colleges in the United States ..	278
Proceedings of the zootechnic council, Gorio .....	279
The practice of immunization, Schreiber .....	279
The theory of serum activity, Bail and Hoke .....	279
Is acquired immunity inherited? Konrádi .....	279
The prevention and eradication of stock diseases in South Africa, Theiler ..	279
Carbolic acid in the treatment of bacterial diseases, Pollock .....	279
Spore formation and other biological processes of anthrax bacillus, Růžicka ..	280
The action of anthrax serum, Ascoli .....	280
Combating anthrax and blackleg by protective vaccination, Warringsholz .....	280
The value of the Straus symptom in the diagnosis of glanders, Liénau .....	280
On some nonspecific reactions of mallein, Südmersen and Glenney .....	280
Barium, a cause of the loco-weed disease, Crawford .....	280
The diagnosis of rabies, Williams .....	281
The histological diagnosis of rabies, Babes .....	281
Penetration of tetanus toxin and antitoxin through large intestine, Breton et al ..	281
Development of trypanosomes in tsetse flies and other diptera, Minchin .....	282
Baleri, a trypanosomiasis affecting animals along the Nile, Bouffard .....	282
Studies on tuberculosis .....	282
The relationship between human and animal tuberculosis, Dammann .....	283
Constitution and properties of protoplasm of tubercle bacillus, Auclair and Paris ..	283
Intestinal tuberculosis in calves in infected stables, Ceradini and Fiorentini ..	283
Clinical diagnosis of tuberculosis by means of rectal examination, Storch .....	283
Tuberculosis in dairy cows, with special reference to tuberculin test, Wilson ..	283
The absorption of tuberculin by the rectum, Calmette and Breton .....	283
Tuberculin, Reeser .....	283
Ophthalmo-tuberculin reaction in cattle, McCampbell and White .....	284
Administration of the tuberculin test by stable helpers, Van Leeuwen .....	284
Dangers from tuberculous animal products. Treatment with strychnin, Galtier ..	284
Chronic pseudotuberculosis in Norway, Horne .....	284
Protective vaccination of cattle against hemoglobinuria, Bugge .....	284
Bacilliform piropiasmosis of cattle in Algeria, Soulié and Roig .....	284
Post-partum paralysis of cows, Zehl .....	284
Cattle quarantine law in Nebraska, Hervey .....	285

	Page.
Construction of cattle dips, Cowley .....	285
Bovine bilharziosis in France, Marotel .....	285
<i>Schistosomum bovis</i> and the alterations produced by it, Bertolini .....	285
Sheep scab, Moore .....	285
Use of communal funds in vaccination against swine erysipelas, Bartels .....	285
Hog cholera, Carré, Leclainche, and Vallée .....	285
Utilizing the horse for production of immune serum against hog cholera, Koops .....	285
The horse; its treatment in health and disease, Axe .....	285
The Borna horse disease, Raebiger .....	286
Etiology of infectious pneumonia of horses, Tabusso .....	286
The treatment of foal lameness, Beck .....	286
Experimental leukemia in fowls, Ellermann and Bang .....	286
Avian diphtheria and contagious epithelioma, Fally .....	286
Parasitic amebæ of the intestinal tract of man and other animals, Walker .....	286

## RURAL ENGINEERING.

Progress report on irrigation experiments in Willamette Valley, Oregon, Stover .....	287
The use of small water supplies for irrigation, Fortier .....	287
Irrigation with household waste water, Selkirk .....	287
Drainage in New York, Fippin .....	287
Dust preventives, Page .....	288
The effect of alkali on Portland cement, Tannatt and Burke .....	288
Conditions affecting production of denatured alcohol in the Northwest, Jones .....	288

## RURAL ECONOMICS.

Land reform, Collings .....	289
The agrarian problem in England, Lecarpentier .....	289
The farm labor of rural England, Ryziger .....	289
The farmer and the laborer, Gill .....	289
Report of Irish Agricultural Organization Society, Everard and Anderson .....	289
An uplifting negro cooperative society, Smith .....	290
Jews as farmers .....	290
Agricultural colonies in Palestine .....	290
The internal colonization of Prussia and its application to Mexico, Ludewig .....	290
[The relation of the government to agriculture in Russia], Torne .....	290
State aid to agriculture in foreign and colonial countries, Bear .....	291
Some computed returns of farms in Switzerland .....	291
Agriculture in Siam, Dilock .....	291
Traffic on Chesapeake Bay and Tennessee River, Andrews .....	291
Crop Reporter .....	291

## AGRICULTURAL EDUCATION.

Education [agricultural] .....	291
The New York State College at Ovid, Willers .....	291
Training courses for teachers of agriculture, Crosby .....	292
Course in cereal foods and their preparation, Mitchell .....	292
Agriculture, industries, and home economics in our public schools, Hays .....	292
A course of study in agriculture for the public schools, Youngblood .....	292
The Weather Bureau and the public schools, Weeks .....	292
The school and its grounds, Clark .....	292
The school gardens, II, Caldwell .....	293
Home nature study course, Comstock and Spencer .....	293
Agriculture: Its fundamental principles, Soule and Turpin .....	293

## MISCELLANEOUS.

Yearbook of the Department of Agriculture, 1907 .....	293
Annual Report of Idaho Station, 1907 .....	293
Fourteenth Annual Report of Montana Station, 1907 .....	293
Encyclopedia of agriculture, edited by Green and Young .....	293

# LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

<i>Stations in the United States.</i>		<i>Stations in the United States—Continued.</i>	
Hawaii Station:	Page.	South Dakota Station:	Page.
Bul. 16, July 3, 1908.....	245	Bul. 106, Mar., 1908.....	233
Bul. 17, June 30, 1908.....	261	Bul. 107, Apr., 1908.....	285
Idaho Station:		Bul. 108, May, 1908.....	239
Bul. 60, Dec., 1907.....	288	Texas Station:	
Bul. 61, Feb., 1908.....	256	Bul. 104, Apr., 1908.....	268
Bul. 62, Mar., 1908.....	227	Bul. 105, June, 1908.....	243
Bul. 63, June, 1908.....	276	Vermont Station:	
An. Rpt. 1907.....	214, 293	Bul. 135, June, 1908.....	215, 224

New York State Station:			
Bul. 302, Apr., 1908.....	256		
Ohio Station:			
Bul. 193, May, 1908.....	270		
Circ. 77, [1908].....	231		
Circ. 81, May 25, 1908.....	231		

NOTE.—The publications of the United States Department of Agriculture, except those of the Weather Bureau, may be purchased from the Superintendent of Documents, Washington, D. C. For the publications of the Weather Bureau requests and remittances should be directed to the Chief of the Bureau. The price of *Experiment Station Record* is \$1.50 per volume, or 15 cents per number. The prices of other technical publications are given above. The publications of the State experiment stations are distributed from the stations and not from the Department.

# EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, PH. D., *Assistant Director*.  
Assistant Editor: H. L. KNIGHT.

## EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. BEAL.  
Agricultural Botany and Vegetable Pathology—W. H. EVANS, Ph. D.  
Field Crops—J. I. SCHULTE.  
Horticulture and Forestry—E. J. GLASSON.  
Zootechny and Human Nutrition—C. F. LANGWORTHY, Ph. D.  
Agrotechny, Dairy Farming, and Dairying—R. D. MILNER.  
Agricultural Chemistry—W. H. BEAL, C. F. LANGWORTHY, and R. D. MILNER.  
Economic Zoology, Entomology, and Veterinary Medicine—E. V. WILCOX, Ph. D.  
Rural Engineering—G. A. GRIFFIN.  
Rural Economics—J. B. MORMAN.  
Agricultural Education—D. J. CROSBY.

## CONTENTS OF VOL. XX, NO. 4.

	Page.
Editorial notes:	
Ideals in agricultural research.....	301
Recent work in agricultural science.....	307
Notes.....	395

## SUBJECT LIST OF ABSTRACTS.

### AGRICULTURAL CHEMISTRY.

On the determination of phosphoric acid, Milone.....	307
Standardization of uranium solution for determining phosphoric acid, Repiton.....	307
The determination of potash by the platinum chlorid method, De Vries.....	307
On the volumetric determination of potassium as the cobalti-nitrite, Drushel.....	307
Volumetric method for carbonic and other acids in air, Henriet and Bouyssy.....	308
Detection of small quantities of carbon monoxid in air, Ogier and Kohn-Albrest.....	308
A new method of enumerating bacteria in air, Winslow.....	308
Determination of nitric acid in water, Grünhut.....	308
Observations on hardness in water and its removal, Basch.....	308
Lead in drinking water, and methods of determination, Woudstra.....	308
Süchting's improved method of determining acidity of soils, Van Schermbeek.....	308
Süchting's improved method of determining acidity, Tacke and Süchting.....	309
Estimation of sugar by the Allihn or Meissl method, Schaumann.....	309
The volumetric determination of reducing sugars, Ling et al.....	309
Quantitative estimation of glycogen by means of inversion with acids, Grebe.....	309
Methods for preparing lecithin and other phosphatids from seed, Schulze.....	309
Observations on the stability of lecithin, Long.....	309
On the oxidation of olive oil, Gill.....	309
Note on honey analysis, Schaffer.....	309
Honey, Reinsch.....	309
Estimation of ash content and Ley reaction in honey analysis, Utz.....	309
Judging marmalades, Härtel.....	309
Sampling and judging ground white pepper, Spaeth.....	309
A new pepper adulterant, Petkoff.....	310
Lead in cream of tartar, tartaric acid, and citric acid, Taftöck and Thomson.....	310
The copper content of cocoa shells, Tisza.....	310
The detection of cocoa shell in cocoa goods, Devin and Strunk.....	310
The chemical standardization of cider and perry, Durham.....	310
Legislation of different countries regarding sulphuring of wine, Mastbaum.....	310
The detection of formic acid in foods, Woodman and Burwell.....	310
The quantitative estimation of rice hulls in feeding stuffs, Schröder.....	310

	Page.
Regarding the methods of investigations of butter and other fats, Grimmer . . .	310
Detection of cocoanut oil in butter by means of the "silver value," Barthel . . .	311
Notes regarding cacao butter, Strube and Sohne . . . . .	311
Digestion and distillation apparatus for nitrogen determination, Jakob . . . . .	311
The determination of nitrogen according to Dumas, Leeman . . . . .	311
Flask for fat determination, Dubois . . . . .	311
Report on progress in agricultural chemistry during the last year, Stutzer . . . .	311
Annual report for 1907 of the consulting chemist, Voelcker . . . . .	311

## METEOROLOGY—WATER.

Wireless telegraphy and meteorological information . . . . .	311
Application of wireless telegraphy to storm warnings, Bigourdan . . . . .	311
The development of meteorological observations in Africa . . . . .	311
Weather observations in cultural and fertilizer experiments, Grohmann . . . . .	311
Temperature conditions of the earth, Hottinger . . . . .	312
Monthly Weather Review . . . . .	312
Meteorological observations at Massachusetts Station, Ostrander and Lindblad .	312
Meteorology, Christensen and Edmiston . . . . .	312
Meteorological statistics, Stupart . . . . .	313
How much rain does the earth receive annually? . . . . .	313
The damage done by cyclones . . . . .	313
On hail protection appliances, Violle . . . . .	313
The underground waters of Cape Colony, Juritz . . . . .	313
Chemical analyses of water from dew ponds, Skinner . . . . .	313
The drinking water supply of cities from a chemical standpoint, Hempel . . . .	313

## SOILS—FERTILIZERS.

Soil surveys in the United States . . . . .	314
Cartography of southwestern Louisiana, Harris . . . . .	314
Results of analyses of soils, Villaseñor . . . . .	314
Soil analysis . . . . .	314
Manuring of Rhodesian soils . . . . .	314
Contribution to the study of the Amur region, Shchusev . . . . .	314
Tea soils of Black Sea coast, China and Japan, Zemyatchenskiĭ and Adamov .	314
Contribution to the study of soils, De Sornay . . . . .	314
The productiveness of the soil: Geological and climatological factors, Grégoire .	314
Oroclimatic basis of classification of soils, Vysotski . . . . .	314
Investigations on processes of weathering, Glinka . . . . .	314
The nature of clay soils according to old and recent investigations, Atterberg .	315
On the eolian origin of the soil salts, Pivovarov . . . . .	315
Denudation of the steppe, Ivchenko . . . . .	315
Humus, McMurtrie . . . . .	316
On changes of availability of nitrogen in soils, II, Loew and Aso . . . . .	316
The enrichment of soil in nitrogen by bacteria and its significance, Stoklasa . .	316
The biology of root tubercle bacteria of leguminous plants, Fuhrmann . . . . .	316
Accumulation of green manure nitrogen in light sandy soils, Von Seelhorst . . .	316
On observation of the continuous growth of peas on the same soil, Suzuki . . . .	316
Maximum productiveness of soils in pots, Gedroiz . . . . .	317
Need of fertilizing by Russian soils according to vegetation method, Gedroiz .	317
Available phosphoric acid in chernozem soils, Kudashev . . . . .	317
Washing of soils and methods of prevention, Mosier . . . . .	317
The Bremen moor culture station, Tacke . . . . .	317
Examinations of manure on Danish farms, Kristensen and Hansen . . . . .	318
Experiments with liquid manure especially as to storage, Kristensen . . . . .	318
Manure statistics, Ringelmann . . . . .	319
Experiments with new nitrogenous fertilizers, Von Feilitzen . . . . .	319
Results of trials with nitrogenous fertilizers, 1907, Söderbaum . . . . .	319
Tests of new nitrogenous fertilizers on potatoes and turnips in 1907, Bauwens .	320
Efficacy of calcium cyanamid Namba and Kanomata . . . . .	320
Fertilizer experiments with phosphates on Finnish moor land, Rindell . . . . .	320
Experiments with high and low percentage Thomas slag, Schweickert . . . . .	320
Value of refuse lime on moor soils, Von Feilitzen . . . . .	320
Gypsum as a manure, Takeuchi . . . . .	320
Why are poor sandy soils often easily injured by liming? Yokoyama . . . . .	321
On the depression of growth by large doses of lime, Kanomata . . . . .	321
On the absorption of varying amounts of lime and magnesia by plants, Takeuchi .	321

	Page.
On the agronomical equivalent of artificial magnesium carbonate, Kanamori.....	321
Top-dressing with magnesium sulphate, Sirker.....	321
Manganese compounds as fertilizers for maize, Sutherst and Ingle.....	322
Do manganese salts stimulate plant growth? Rhodin.....	322
Modern niter beds.....	322
Crude ammonia, Sévegrand.....	322
On the manufacture and application of peat litter, Rautakoski.....	322
The extraction of potash from feldspathic rock, Cushman and Hubbard.....	322
The commercial fertilizer industry, Stange.....	322
The development of the superphosphate industry in Italy, Maizières.....	322
Lime and its relation to agriculture, Wicken.....	323
Vegetable ash as a manure, Guerrero.....	323
Fertilizer and oil, Marsh and Cobb.....	323
Inspection of commercial fertilizers, Trowbridge.....	323
Analyses of commercial fertilizers, Stackhouse and Hardin.....	323
Comments upon the State-fertilizer law, Knisely.....	323

## AGRICULTURAL BOTANY.

Report of the department of botanical research, MacDougal.....	323
Physiological constant for germinating stage of cress, Waugh and Pomeroy....	324
The transpiration current in plants, Janse.....	324
The chemical nature of root secretions, Stoklasa and Ernest.....	325
The structure of root tubercles in leguminous and other plants, Bottomley....	325
Assimilation of atmospheric nitrogen by <i>Lolium temulentum</i> , Hannig.....	325
Heredity in plants and animals, Wood and Punnett.....	325
A critical review of the known cases of bud variation, Cramer.....	325
Suggestions concerning certain bud variations, East.....	325
Variation in peas, Waugh and Pomeroy.....	325
Gray's new manual of botany, Robinson and Fernald.....	326
Handbook of flower pollination, Knuth, trans. by Davis.....	326

## FIELD CROPS.

A lesson in intensive farming, Forbes.....	326
Report of the agriculturist, Brooks, Fulton, and Gaskill.....	327
Seeding mowings, Brooks.....	327
[Early Amber sorghum and alfalfa], Lindsey.....	327
Observations on nurse crops for alfalfa, Clark.....	328
Disk-harrowing alfalfa, Forbes.....	328
Alfalfa, Shaw.....	328
Dodder in alfalfa seed, Stewart and French.....	328
Culture tests with varieties of barley in 1905 and 1906, Boonstra.....	328
Irrigation of barley, Nowell.....	329
Contributions to the biochemistry of barley, Ford and Guthrie.....	329
Cotton culture, Veauvy and Coste.....	330
Some conditions influencing cotton production, Newman.....	330
The nitrogen content of Egyptian cotton, Schindler.....	331
The cultivation of potatoes, Soule and Vanatter.....	331
The skin of different potato varieties, Kreitz.....	332
Influence of cross- and self-fertilization on sugar in sugar beet, Andrlík et al....	333
The essential mineral constituents of the sugar cane, Murakami.....	333
Cultivation of the sugar cane in Peru.....	333
Virginia tobacco experiments, Mathewson, Anderson, and Cocke.....	333
Results of seed investigations for 1907, Pammel and King.....	334
Pure seed investigations, Gregory.....	335
Seed work, Stone.....	335
Development of plant breeding in Denmark, Sweden, and Probstel, Holtmeier....	335

## HORTICULTURE.

Experiments in drug plant cultivation, Hood.....	335
The Montreal market muskmelon industry, Stuart.....	335
Tomato notes, Munson.....	336
Moisture and decay loss of Hubbard squash in storage, Stuart.....	336
Fruit list for 1908.....	336
Orchard survey of Wasco County, Lewis and Allen.....	336
Feeding the orchard, Waters.....	336
Tillage and mulch, Hedrick.....	337

	Page
Notes on the propagation of apples, Waugh .....	337
Sugar and acidity of pears from formation to maturity, Rivière and Bailhache .....	337
Manurial experiments with limes, Nicholls and Watts .....	338
Cacao manurial plots [in Dominica], Watts .....	338
Small fruits in 1906, Pillsbury .....	339
Cranberry substations, Brooks .....	339
Through the vineyards of the Spanish Peninsula, Poirier .....	339
Seasonal influence in carnation crossing relative to seed production, Stuart .....	339

## FORESTRY.

Georgia's forest resources, Harper .....	339
Report on an examination of certain swamp lands belonging to the State, Ashe .....	339
Suggestions for arbor day planting, Thornber .....	340
The trees of Great Britain and Ireland, Elwes and Henry .....	340
Report on the forests of Kenia, Hutchins .....	340
Edible trees and shrubs, Peacock .....	340
List of jungle products used by the poor during the famine, 1896-97, Innes .....	340
Growth of pines from native and northern seed in the Eberswalde, Dengler .....	340
Breaking tests with twenty-one Surinam woods, Plasschaert and Ligtenberg .....	341
Transverse tests of jarrah made at Sydney Technical College, Nangle .....	341
The relation of forests to stream control, Pinchot .....	341
The sources of fumes in Saxony and their influence upon forestry, Schröter .....	341
Popular bulletins of the Swedish Forestry Association .....	342
A summary of the results of forest administration in Saxony for the year 1906 .....	342
Report on Norwegian forestry, 1906, Saxlund .....	342
Annual of streams and forests for 1908 .....	342
Review of forest administration in British India for 1905-6, Eardley-Wilmot .....	342
Report on forest administration in Ajmer-Merwara for 1906-7, Prasad .....	342
Progress report on forest administration in Coorg for 1906-7, McCarthy .....	343
Administration report of forest department of Madras presidency, 1906-7 .....	343
Progress report on forest administration in the Punjab for 1906-7, Fisher .....	343
Forest administration in the United Provinces 1906-7, Lovegrove and Jackson .....	343
Progress report of the Imperial Forest Research Institute for 1906-7 .....	343
Forest service in Indo-China, Capus .....	343
Note on experimental rubber cultivation in the Bombay presidency, Gammie .....	343
Cultivation of rubber plants on the Malay Peninsula, Carle .....	343
On the extraction of rubber from dried rubber plants, Alexander and Bing .....	343

## DISEASES OF PLANTS.

Report of the botanists, Stone and Chapman .....	344
The occurrence of plant diseases in 1907, Giddings .....	345
Report of the vegetable pathologist, McAlpine .....	345
Rusts of cereals and other plants, Olive .....	345
Cotton wilt in the Central Provinces, Evans .....	345
The presence in Germany of <i>Pseudoperonospora cubensis tuerensis</i> , Ewert .....	346
Leaf spot disease of eggplants, Voglino .....	346
Potato spraying experiments, Jones and Giddings .....	346
A new tomato disease, Güssow .....	346
Experiments on the control of gooseberry mildew, Vasilev .....	347
Fruit tree diseases and fungicides, Rolis .....	347
Notes on a cherry disease in Western Germany, Ewert .....	347
Preliminary report on dust spraying experiments in Georgia, Chase .....	347
The coconut stem disease, Petch .....	347
The biology of <i>Polystictus versicolor</i> , Bayliss .....	348
The chestnut canker, Murrill .....	348
The bleeding and yellowing of poplars, Blankinship .....	348
The damping off of coniferous seedlings, Jones .....	349

## ECONOMIC ZOOLOGY—ENTOMOLOGY.

Deer farming in the United States, Lantz .....	349
Silver fox farming, Osgood .....	350
A study of the food habits of birds, Leisewitz .....	350
Bird preservation. Spraying, Surface .....	350
Report of the entomologists, C. H. and H. T. Fernald and Summers .....	350
Insects of 1907, Pettit .....	350
Fifth annual report of the State entomologist of Montana, Cooley .....	351

	Page.
Report on injurious insects observed in midland counties during 1907, Collinge .	351
New species of Diaspine scale insects, Marlatt .....	351
The scale insects of Argentina, Autran .....	352
Scale insects from Amani, Lindinger .....	352
Remedies for the San José scale and directions for their use, Parrott .....	352
The Argentine ant in California, Woodworth .....	352
The mound-building prairie ant, Headlee and Dean .....	352
The gipsy moth in Connecticut, Britton .....	352
<i>Phylloactus abdeus</i> , Schulz .....	353
The insect pests of cardoon, Lesne .....	353
The frit fly .....	353
Spraying apple orchards for insects and fungi, Pickett .....	353
Demonstration spraying for bitter rot and codling moth, Faurot .....	353
Suggestions for the control of the codling moth, Thornber .....	353
An olive pest, Navarro .....	353
Insects and diseases of the orange, Cook and Horne .....	353
Combating <i>Tortrix ambiguella</i> and <i>Eudemis botrana</i> , Dewitz .....	354
Experiments in combating the grape-berry moth, Capus and Feytaud .....	324
<i>Zeuzera pyrina</i> on cork oak in Algeria, Lesne .....	354
The Douglas spruce cone moth, Cooley .....	354
Pebrine and related Microsporidia, Lutz and Splendore .....	354
Fixation and multiplication of trypanosomes in proboscis of tsetse fly, Roubaud .....	354
The use of arsenicals, Degrully .....	355
The choice of arsenicals for insecticide purposes, Grosjean .....	355
Fungicides, insecticides, and spray calendar, Favor .....	355
Spray calendar, Conradi .....	355
Fumigation with hydrocyanic-acid gas .....	355
The queen of honey bees. A case of atavism, Demoll .....	355
Apiculture, Ichès .....	355
Bee keeping in North Carolina, Sherman, Jr .....	355
Bee keeping in Ontario .....	356
Bee diseases in Massachusetts, Gates .....	356
A new method of controlling flaccidity of silkworms, Gasparini .....	356

## FOODS—HUMAN NUTRITION.

The amount of extractive material in dark and light meat, Adler .....	356
Commercial cuts of meat on the block .....	357
The native oysters of the west coast, Stearns .....	357
Milling qualities of wheat, Stewart and Greaves .....	357
The baking quality and the bleaching of flour, Hoffmann .....	358
Bread used by peasants, Grüner .....	358
Breakfast foods, Frear .....	358
Examination of a new preparation, "ice cream powder," Ferrari-Lelli .....	358
The proteins of rice, Rosenheim and Kajiura .....	359
Comparison of potatoes and rice, Shipman .....	359
The uses and composition of tamarind seeds, Hooper .....	359
The staff tree as a former food supply of starving Indians, Dillingham .....	359
Strained honey, McGill .....	359
Sophistication of honey, Zimmermann .....	359
New preserved fruit products, Halmi .....	359
The composition of fresh avocado fruit, Pairault .....	360
Dried bananas from Queensland .....	360
Enzymes in relation to the ripening of fruit, Tallarico .....	360
<i>Vitis opaca</i> and its enlarged rootstock, Baker and Smith .....	360
Examination of an oil-yielding fruit from Kamerun, Brieger and Krause .....	360
Concerning the oil content of different olive samples, Passerini .....	360
Examination of fruit juices, Sunde .....	360
Concerning barberry juice, Schulze .....	360
Concerning orange juice, Stüber .....	360
Studies of organic phosphorus compounds in wine, Funaro and Rastelli .....	360
Composition of wine from Urbino, Agrestini .....	360
Blberry wine, Donselt .....	360
Kafir beer, Chapman and Baker .....	360
The manufacture of cocoa with definite fat content, Böhme .....	361
The aroma of black tea, Katayama .....	361
Gulasch extract, Schulze .....	361
Economical preservation of food, Garrett .....	361

	Page
Preserving wild mushrooms, Pernot .....	361
Different methods of preserving meat, Razous and Nourissé .....	361
The fireless cooker, Witt .....	361
Effect of benzoic acid and benzoates upon digestion and health, Wiley .....	361
Preservatives in food and the effect thereof on the public health, Wiley .....	362
[Food and dairy laws] .....	362
Food of a large city. Sources and average food supply of Paris, Payen .....	363
Food and fare in Italy, Yates .....	363
Diet and hygiene in Korea, Wells .....	363
Composition and energy value of food of the soldier, Pembry and Parker .....	363
[Nutritive value and cost of food served in a student boarding club], Hunt .....	363
A day's ration with student valuations, Dickinson .....	363
The provision of meals for school children, Crowley .....	363
Lessons in practical hygiene for use in schools, Ravenhill .....	363
The elements of the chemical physiology of digestion, Schmidt-Nielsen .....	364
Progress in proteid chemistry, Abderhalden .....	364
Protein synthesis in the animal body, Henriques .....	364
Influence of an excess of fat in the diet on metabolism, Biernacki .....	364
Cotton-seed oil taken in food and injected, Lendrich .....	364
Carbohydrate metabolism, McGuigan .....	364
Sugar in the ration during military maneuvers, Joly .....	365
Cleavage in metabolism, Pütter .....	365
The constitution of carnitin, Krimberg .....	365
Creatin and creatinin, Mellanby .....	365
Studies of the cholesterin group, Menozzi .....	365
Body temperature and periodicity, Osborne .....	365
Work under pressure and in great heat, Haldane .....	366

## ANIMAL PRODUCTION.

Inspection of feeding stuffs .....	366
Feed stuffs, Rose .....	366
Execution of the [Massachusetts] feed law, Lindsey .....	366
German meadows and the estimation of the value of meadow hay, Naumann .....	367
The composition and digestibility of hay from sewage meadows .....	367
The native fodder plants of New South Wales, Maiden .....	367
Ensiled beet pulp and its by-products, Giele .....	367
Buckwheat feed, Woll .....	367
Nutritive value of nonproteid nitrogenous constituents of hay, Kellner .....	367
Value of glutaminic acid and aspartic acid as nutrients, Andrlík and Velich .....	367
Fat formation from protein and methods of estimating fat, Bogdanow .....	367
Studies of the digestibility of dried potatoes, Kellner et al. ....	368
Digestion experiments, II, Knight, Hepner, and McConnell .....	368
A feeding experiment with hay, turnips, and cut straw for sheep, Säland .....	368
Fertility in Scottish sheep, Marshall .....	369
Carakul sheep, Meuleman .....	369
Carakul sheep and their possible use in sandy regions of Germany, Kühn .....	369
Raising and fattening calves on skim milk, Dornic and Daire .....	369
Beef production, II, III, Skinner and Cochel .....	369
Fifty years among Shorthorns, Bruce .....	369
Congo cattle, Meuleman .....	369
Inverted starch in pig feeding, Sevenster .....	369
Supplements to corn for fattening hogs in dry lot, Skinner and Cochel .....	369
Hog feeding, Quick and Spencer .....	370
Paddock feeding of pigs, Sawyer .....	371
Fattening pigs, Brandt .....	371
Standardizing breed characteristics, Spillman .....	371
Breeds of horses, Diffloth .....	371
The horses of the British Empire, edited by Trafford et al. ....	371
Types and breeds of horses in the Russian Empire, edited by Goulkevich .....	371
Horse feeding with saccharin substances .....	371
The use of bonnets for horses, D'Anchald .....	371
Market classes of mules and breeding them .....	372
Animal food for chickens, Houssay .....	372
Poultry experiments, Brooks, Fulton, and Gaskill .....	372
The poultry export trade, Hart .....	372
Poultry culture, Graham .....	372
Practical poultry houses and fixtures, Hunter .....	372
Scaliness and unopened feathers in the ostrich, Duerden .....	372

	Page.
Farmer's cyclopedia of live stock, Wilcox and Smith .....	372
Animal husbandry in Denmark, 1907, Appel .....	373
Pastoral industry .....	373

## DAIRY FARMING—DAIRYING—AGROTECHNY.

A test of soiling crops for dairy cows, Mairs and Putney .....	373
Cooperative dairy investigations, Flint and Dorman .....	373
Milk production. I, Herd improvement. II, Feeding, Hopper .....	374
Cows <i>v.</i> cows, Fraser .....	374
Improving dairy conditions, Trueman .....	374
Reconstruction of dairy barns .....	374
Amyl alcohol in testing [cream], Eckles and Wayman .....	374
The Babcock test, Liverance .....	374
The cost of testing pure-bred cows, Lindsey .....	374
Standard for Babcock glassware, Holland .....	374
Supervision of the milk supply .....	374
Fourth International Dairy Congress, 1909 .....	374
The National Creamery Buttermakers' Association, 1908 .....	375
The chemical composition of milk, Lindsey .....	375
The effect of food upon the composition of milk and butter fat, and upon the consistency or body of butter, Lindsey .....	376
<i>Bacillus casei</i> $\epsilon$ and <i>Mycoderma thom</i> in manufacture of Grana cheese, Fascetti .....	377
Olmützer cheese, Pavelka .....	377
Cheese making in Cuba, Mayo and Elling .....	377
Mannitic fermentation in apple and pear cider, Truelle .....	377
Honey vinegar, Vinson .....	377
Vinegar from whey, Marre .....	378

## VETERINARY MEDICINE.

Progress in study of pathogenic micro-organisms, Von Baumgarten and Tangl .....	378
The poisonous effects of blood of different species, Lefmann .....	378
Immunization against calf dysentery, swine plague, etc., Bugge .....	378
Injurious fodder and poisonous plants, Güssow .....	378
Report of the veterinarian, Nelson .....	379
Report for 1907 of the principal of the royal veterinary college, McFadyean .....	379
The standardization of tetanus antitoxin, Rosenau and Anderson .....	379
The cause of milk sickness or trembles, Jordan and Harris .....	379
Properties of trypanosomes resistant to atoxyl and sera, Mesnil and Brimont .....	380
The relation between human and bovine tuberculosis, Eber .....	380
Points of entrance of tuberculosis, Railliet .....	380
Mode of infection and immunity in tuberculosis, Klebs .....	380
Hematogenous tuberculosis, Morpurgo .....	381
The occurrence of latent tubercle bacilli in the lymphatic glands, Joest .....	381
Eradication of tuberculosis, Niven .....	381
Contagious abortion in cattle, Wilson .....	381
Retention of the afterbirth in cattle, Pomayer .....	382
Hook-worm disease of cattle, Conradi and Barnett .....	382
Milk fever: Its prevention and successful treatment .....	382
Notes on the cattle tick and tick fever of cattle, Dinwiddie .....	382
Tick eradication in Arkansas in 1907, Lenton .....	383
The cattle tick, Lewis .....	383
Cattle dipping, Power .....	383
A specific lung disease of calves, Bevan .....	384
Scab: Its nature, cause, symptoms, and treatment, Hutcheon .....	384
Anemia and pasteurellosis, Lignieres .....	384
Swine erysipelas, Holth .....	384
Occurrence of the bacilli of swine erysipelas in the gall bladder of hogs, Pitt .....	384
A germ-free extract for the prevention of swine plague, Pfeil .....	384
The poisoning of hogs by kitchen swill, Fresenius .....	385
The horse: Ailments and accidents, Barton .....	385
Cutaneous and conjunctival reaction in glanders, Dietrich .....	385
Mallein reaction, Miessner .....	385
Intratracheal injection of iodine for joint ill in foals, Lothian .....	385
Preliminary report on the so-called cerebro-spinal meningitis of horses, Mills .....	385
A new method of vaccination against strangles, Barnichello .....	386
Statistical data on dog distemper, Wirth .....	386

	Page.
Report of the veterinarian, Paige .....	386
Fatal septicemia in young chickens or white diarrhea, Rettger and Harvey ..	386
Spirochetosis of fowls in southern Rhodesia, Bevan .....	386

## RURAL ENGINEERING.

Practical irrigation: Its value and cost, Bowie, Jr .....	387
Administration of irrigation services in Egypt and the Sudan for 1906.....	387
Experiments in irrigation, Gerlach and Krüger .....	387
Measurement of water, Tannatt and Kneale .....	388
Preliminary tests of sugar-house machinery, Kerr .....	388
Applications of electricity to agriculture, Hermenegildo Gorria .....	389
The equipment of farms and country houses with electricity, Bates .....	389

## RURAL ECONOMICS.

The mistakes of farm management as determined by bookkeeping .....	389
Piecework in agriculture, Stieger .....	389
What influence has piecework upon the agricultural labor problem? Römer ..	389
The Belgian migratory laborer, Ryziger .....	389
Second congress of mutual credit and agricultural cooperative societies, Lesourd ..	390
Mutual agricultural insurance societies in 1908 .....	390
Report on cooperative societies in the Punjab for 1907, Wilberforce .....	390
International agricultural institute, Griscom .....	390
The modern state and agriculture, Gomes Carmo .....	390
America's amazing agricultural advance .....	390
The American farmer feeding the world, Hays .....	390
Agricultural development of northwest provinces of Canada, Godfrey .....	391
Agriculture in Denmark, Tisserand .....	391
Notes on agriculture in South Australia, Summers .....	391
[Agricultural statistics of Australia], Knibbs .....	391
Agriculture in Japan, Sharp .....	391
Crop Reporter .....	391

## AGRICULTURAL EDUCATION.

Agriculture the basis of education, Cook .....	391
The mission of the Christian college, Reed .....	392
Development of agricultural education, Brown .....	392
The agricultural college and its relationship to national education, Wickson ..	392
What has been done for popular education in agriculture, Balcomb .....	392
Agriculture in normal schools, Balcomb .....	392
On the training of persons to teach agriculture in the public schools, Bailey ..	392
Work of National Government in extending agricultural education, Crosby ..	392
Report of committee on industrial education in schools for rural communities ..	392
Agricultural instruction for soldiers, Maier-Bode .....	393
School gardens, Vercier .....	393
Farm bacteriology, Palmer .....	393
Hints for eastern Oregon farmers, Withycombe et al .....	393

## MISCELLANEOUS.

Twentieth Annual Report of Massachusetts Station, 1907 .....	393
Annual Report of Pennsylvania Station, 1907 .....	393
Nineteenth Annual Report of Tennessee Station, 1906 .....	394
Seventeenth Annual Report of Utah Station, 1906 .....	394
Twentieth Annual Report of Vermont Station, 1907 .....	394
Abstract Twentieth Report, 1906-7 .....	394
Thirteenth Annual Report of Washington Station, 1903 .....	394
Fourteenth Annual Report of Washington Station, 1904 .....	394
Fifteenth Annual Report of Washington Station, 1905 .....	394
[Index of Volume IV of Arizona Station publications], Hayes .....	394
Experiment Station Work, XLVII .....	394

# LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

## *Stations in the United States.*

	Page.
Arizona Station:	
Bul. 57, June 20, 1908.....	326,
328, 340, 353, 377, 381	
Index Bul., 1902-1905 .....	394
Arkansas Station:	
Bul. 101, 1908 .....	382, 383
California Station:	
Circ. 38, Aug., 1908 .....	352
Connecticut Storrs Station:	
Bul. 52, June, 1908 .....	372
Bul. 53, June, 1908 .....	374
Georgia Station:	
Bul. 80, July, 1908 .....	373
Illinois Station:	
Circ. 118, Apr., 1908 .....	374
Circ. 119, May, 1908 .....	317
Circ. 120, May, 1908 .....	353
Indiana Station:	
Bul. 126, June, 1908 .....	369
Circ. 11, Dec., 1907 .....	374
Circ. 12, May, 1908 .....	369
Circ. 13, June, 1908 .....	374
Circ. 14, July, 1908 .....	369
Iowa Station:	
Bul. 99, June, 1908 .....	334, 335
Kansas Station:	
Bul. 154, Apr., 1908 .....	352
Louisiana Stations:	
Bul. 106, July, 1908 .....	385
Bul. 107, 1908 .....	388
Geological Survey Bul. 6, 1907 ..	314
Massachusetts Station:	
Bul. 124, July, 1908 .....	356
Met. Buls. 235-236, July-Aug.,	
1908 .....	312
Circ. 15, July, 1908 .....	374
Circ. 16, July, 1908 .....	327
Twentieth An. Rpt. 1907 ..	324, 325,
327, 335, 337, 339, 344, 350,	
366, 372, 374, 375, 386, 393	
Michigan Station:	
Bul. 251, Mar., 1908 .....	350
Circ. 1, June, 1908 .....	328
Circ. 2, June, 1908 .....	374
Missouri Station:	
Bul. 80, June, 1908 .....	323
Circ. Inform. 22 .....	336
Circ. Inform. 23, Apr., 1906 ..	355
Missouri Fruit Station:	
Bul. 15, Dec., 1906 .....	353
Bul. 16, Mar., 1907 .....	347
Montana Station:	
Bul. 70, Feb., 1908 .....	354
Bul. 71, Feb., 1908 .....	351
Bul. 72, Feb., 1908 .....	388
New York State Station:	
Bul. 303, July, 1908 .....	366
Circ. 8, Jan. 20, 1907 .....	328
Circ. 9, Jan. 15, 1908 .....	352

## *Stations in the United States—Continued.*

	Page.
Oklahoma Station:	
Circ. Inform. 11, June, 1908 ..	383
Oregon Station:	
Bul. 97, Jan., 1908 .....	323
Bul. 98, Jan., 1908 .....	361
Bul. 99, Mar., 1908 .....	336
Circ. Bul. 2, 1908 .....	393
Pennsylvania Station:	
An. Rpt. 1907 .....	312, 339, 373, 393
South Carolina:	
Bul. 137, May, 1908 .....	382
Bul. 138, June, 1908 .....	323
Bul. 139, June, 1908 .....	382
Bul. 140, June, 1908 .....	330
South Dakota Station:	
Bul. 109, June, 1908 .....	345
Tennessee Station:	
Nineteenth An. Rpt. 1906 .....	394
Texas Station:	
Circ. 10, 1907 .....	355
Utah Station:	
Bul. 103, Apr., 1908 .....	357
Seventeenth An. Rpt. 1906 .....	394
Vermont Station:	
Bul. 136, June, 1908 .....	394
Bul. 137, July, 1908 .....	394
Twentieth An. Rpt. 1907 .....	335,
336, 339, 345, 346, 349, 394	
Virginia Station:	
Bul. 174, Aug., 1907 .....	331
Bul. 175, Jan., 1908 .....	333
Bul. 176, July, 1908 .....	370
Washington Station:	
Thirteenth An. Rpt. 1903 .....	394
Fourteenth An. Rpt. 1904 .....	394
Fifteenth An. Rpt. 1905 .....	379, 394
West Virginia Station:	
Bul. 117, June 1, 1908 .....	336
Wyoming Station:	
Bul. 77, May, 1908 .....	329
Bul. 78, June, 1908 .....	368

## *U. S. Department of Agriculture.*

Farmers' Bul. 328 .....	350
Farmers' Bul. 329 .....	394
Farmers' Bul. 330 .....	349
Bureau of Chemistry:	
Circ. 39 .....	361
Bureau of Entomology:	
Bul. 16, pt. 2 (tech. ser.) (15	
cents) .....	351
Bureau of Statistics:	
Crop Reporter, vol. 10, No. 10,	
Oct., 1908 .....	391
Weather Bureau:	
Monthly Weather Review, vol.	
36, Nos. 5-6, May-June, 1908,	
(20 cents per number, \$2.50	
per year) .....	312

# EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, PH. D., *Assistant Director*.  
Assistant Editor: H. L. KNIGHT.

## EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. BEAL.  
Agricultural Botany and Vegetable Pathology—W. H. EVANS, Ph. D.  
Field Crops—J. I. SCHULTE.  
Horticulture and Forestry—E. J. GLASSON.  
Zootechny and Human Nutrition—C. F. LANGWORTHY, Ph. D.  
Agrotechny, Dairy Farming, and Dairying—R. D. MILNER.  
Agricultural Chemistry—W. H. BEAL, C. F. LANGWORTHY, and R. D. MILNER.  
Economic Zoology, Entomology, and Veterinary Medicine—E. V. WILCOX, Ph. D.  
Rural Engineering—G. A. GRIFFIN.  
Rural Economics—J. B. MORMAN.  
Agricultural Education—D. J. CROSBY.

## CONTENTS OF VOL. XX, NO. 5.

Editorial notes:	Page.
The principal function of the Association of American Agricultural Colleges and Experiment Stations .....	401
Affiliation of associations devoted to agricultural science .....	402
The place of extension work in the association .....	402
Educational aspects of the National Corn Exposition .....	403
Convention of Association of American Agricultural Colleges and Experiment Stations, 1908 .....	406
Recent work in agricultural science .....	417
Notes .....	492

## SUBJECT LIST OF ABSTRACTS.

### AGRICULTURAL CHEMISTRY.

Determination of sodium and potassium in silicates, Thomsen .....	417
Determination of potash in soils, Ronnet .....	417
Volumetric method for phosphoric acid in superphosphates, Kohn .....	418
The volumetric determination of phosphoric acid in superphosphates, Moeller ..	418
The titration of phosphoric acid in superphosphate solutions, Kohn and Schucht ..	418
The systematic investigation of drinking waters, Romijn .....	418
Determination of combined carbonic acid in water, Lunge .....	418
The determination of combined carbon dioxide in water, Noll .....	418
Examination of eggs with colored shells, Borchmann .....	418
The formic acid content of honey, Farnsteiner .....	418
Methods for analysis of maple products and detection of adulterants, Bryan ..	419
Amount of soluble silicic acid in cocoa beans, Matthes and Rohdich .....	419
Plant fats and fat mixtures used in chocolate manufacture, Sachs .....	419
Comparative tests of different methods of measuring fat in milk, Dehaye ..	419
A milk constant as a basis of judgment, Cornalba .....	419
Study of recent methods of analysis of butter, Jean .....	419
The nonsaponifying constituents of cocoa butter, Matthes and Ackermann ..	419
Refractometric analysis of cognac, Frank .....	420
Examination of feces for nitrogen of metabolic products, Stutzer et al. ....	420
The analysis of coal tar creosote and cresylic acid sheep dips, Chapin ..	420
The analysis of turpentine by fractional distillation with steam, Geer ..	420
The examination of turpentine and turpentine substitutes, Coste .....	420
Proceedings of the Sixth International Congress of Applied Chemistry .....	421
Report on progress in industrial inorganic chemistry, Hölbling and Preiss .....	421

## METEOROLOGY—WATER.

	Page.
Annals of the Astrophysical Observatory, Abbot and Fowle, Jr.....	421
Solar heat received by the surface of the soil, Loisel.....	422
Origin of ozone and variations in carbon dioxid of air, Henriot and Bouyssy....	422
Meteorological observations at Storrs for the years 1905 and 1906, Esten.....	422
Meteorological summary for 1906, Patton.....	422
The weather during the agricultural year, 1906-7, Brodie.....	422
Climatology.....	423
Present trend of investigation on underground waters, Kemp.....	423
A study of the waters of Rio Verde, Urbina.....	423
Water supply for villages, Phelps.....	423
The broad irrigation sewage farm at Fresno, California.....	423
Elements of water bacteriology, Prescott and Winslow.....	423

## SOILS—FERTILIZERS.

The production of active nitrogen in the soil, Fraps.....	424
Absorption by soils, Patton and Waggaman.....	426
Seven years' soil investigation in southern Illinois, Hopkins et al.....	428
The maintenance of fertility.....	428
Plans and summary tables of experiments at Wooster on soil fertility.....	428
Farmyard manure, Hall.....	428
Contribution to knowledge of microflora of barnyard manure, Löhnis and Kuntze.....	428
Green manuring experiments, Zimmermann.....	428
The nitrogen question, Grégoire.....	428
Experiments with nitrogenous fertilizers, Schreiber.....	428
Investigations on sulphate of ammonia and nitrate of soda as fertilizers, Blobel.....	429
Nitrate of soda and sulphate of ammonia, Damseaux.....	429
On sulphate of ammonia containing free sulphuric acid, Lemmermann.....	429
The effect of the new nitrogenous fertilizers on hemp, Stöhr.....	429
Comparative experiments with nitrogen lime and nitrate of soda, Kuhnert.....	429
Nitrogen fertilizers, Stutzer.....	429
On the influence of sterilization on the solubility of lime nitrogen, Kappen.....	429
The behavior of lime nitrogen in storage, Von Feilitzen.....	430
Experiments with calcium cyanamid, 1907.....	430
The fertilizing action of calcium cyanamid, De Grazia.....	430
The manufacture of calcium cyanamid, Kershaw.....	430
The actual state of the nitrate of lime industry in Norway.....	430
Phosphates, McMurtrie.....	430
Tunisian phosphates, Bertainchand.....	430
[Phosphate deposits in Tahiti].....	430
Increased production of phosphate rock in 1907.....	430
Potash in granitic soils, Del Campo.....	431
On the utilization of leucite, Manuelli.....	431
The industrial treatment of leucite and leucitic materials, Gallo.....	431
The potash industry.....	431
[Fertilizers in connection with the beet-sugar industry].....	431
Fertilizer experiments with sulphur water, Müller and Störmer.....	431
Fertilizer analyses, Patten, Jodidi, and Collingwood.....	431
Analyses of fertilizers—fall season, 1907, Kilgore.....	431
Analyses of fertilizers—spring season, 1908, Kilgore.....	431
Analyses of commercial fertilizers, Frear.....	431
Commercial fertilizers and poisonous insecticides in 1907-8, Fraps.....	432
Standard fertilizers, 1908, McGill.....	432

## AGRICULTURAL BOTANY.

Mushrooms, edible and otherwise, Hard.....	432
The yeast fungi, Kohl.....	432
Acclimatization of plants, MacMillan.....	432
Effect of partial removal of roots and leaves on development of flowers, Shiga.....	432
Rapid transformation of starch into sucrose during ripening of fruits, Geerligs.....	433
Hydrolytic and catalytic ferments acting during the ripening of fruit, Tallarico.....	434
Transitory presence of hydrogen cyanid in ferns, Greshoff.....	434
On the effects of certain poisonous gases on plants, Osterhout.....	434
International catalogue of scientific literature. M—Botany.....	435

## FIELD CROPS.

	Page.
The rotation of crops, Hays et al.	435
Report of the work at the Holly Springs Station for 1907, Ames	436
The work of the San Antonio experiment farm in 1907, Headley and Hastings	436
Change of vegetation on the south Texas prairies, Cook	437
Dry-land agriculture	437
Dry-land grains, Jardine	437
Alfalfa	437
Winter bur clover, Welborn	439
Cotton experiments, 1907, Perkins	439
Danger in judging cotton varieties by lint percentages, Cook	439
Progress of the beet-sugar industry in the United States in 1907	441
Sugar beets in Virginia, Ellett	441
Varieties of cane, with special reference to nomenclature, Deerr and Eckart	442
Cooperative wheat variety work	442

## HORTICULTURE.

Handbook of fruit culture, Gaucher	442
On the virgin fertility of fruit trees, Glatz	442
The grape in the various stages of maturity, Kelhofer, trans. by Zardetti	443
On some experience in hybridizing grapes, Grimaldi	443
Viticultural notes, Blin	443
Influence of grafting on quality of wines in Anjou, Marquis de Dreux-Brézé	443
Bearing hybrids (grapes) and their wines in 1907, Pée-Laby	443
Statistics on grape and olive products for the year 1907	444
Observations on the various forms of fig ( <i>Ficus carica</i> ), Leclerc du Sablon	444
Observations on change of sex in <i>Carica papaya</i> , Iorns	444
Cacao preparation, and fermentation of coffee and tobacco, Schulte	445
The unheated greenhouse, Davidson	445

## FORESTRY.

North American trees, Britton and Shafer	446
Wayside and woodland trees, Step	446
The conifers and other gymnosperms, Neger	446
Observations on the species grown by the Section of Streams and Forests, Albert	446
The manna gum ( <i>Eucalyptus viminalis</i> ), Albert	446
The red gum ( <i>Eucalyptus resinifera</i> ), Albert	447
The Australian blackwood ( <i>Acacia melanoxylon</i> ), Albert	447
Shelter planting, with special reference to the <i>Acacia</i> and <i>Eucalyptus</i> , Barrett	447
Type and variability in the annual wood increment of <i>Acer rubrum</i> , Dachnowski	447
Preliminary note on development of sal in volume and money value, Caccia	447
Native and planted timber of Iowa, Baker	447
Cooperative forestry work, Green and Secrest	448
National forests with related projects and data	448
Report of the departmental committee on Irish forestry, Gill et al.	448
Departmental committee on Irish forestry	448
Progress report of forest administration in Baluchistan for 1906-7, Singh et al.	448
Report of forest circles in Bombay Presidency, including Sind, 1906-7	449
Reports of the forest administration in Burma for the year 1906-7	449
The preservative treatment of loblolly pine cross-arms, Sherfese	449
Exports and imports of forest products: 1907, Pierson	449
Turpentine and rosin	449
Investigation of Manihot rubber, Schellmann	449

## DISEASES OF PLANTS.

Seed treatment for the smuts of winter barley, Heald	450
Cotton wilt, Orton	450
The potato rot, Gandára	450
<i>Spongiospora solani</i> , or corky scab, Johnson	450
A disease of sea-kale, Salmon	451
Some tomato fruit rots during 1907, Pool	451
A root rot of grapes due to <i>Pestalozzia uvincola</i> , Wolf	451
Arsenical poisoning of fruit trees, Headen	452
The <i>Fusicladium</i> disease of the pear and apple, Lounsbury	452

	Page.
Notes on some diseases of apple trees, Prillieux.....	453
A new form of <i>Sphaeropsis</i> on apples, Walker.....	453
Studies on the genus <i>Gymnosporangium</i> , Kern.....	453
A disease of cloves, Ridley.....	453
Report on cocoanut palm disease in Travancore, Butler.....	454
A disease of rubber trees in Puak, Smith.....	454
The effects of <i>Oidium quercinum</i> on different species of oak, Bureau.....	454
The timber rot fungus ( <i>Merulius lachrymans</i> ), Mez.....	454
The mold of maple sirup, Heald and Pool.....	454

## ECONOMIC ZOOLOGY—ENTOMOLOGY.

The Alaska game law and regulations of the Department of Agriculture, 1908..	455
Officials concerned with the protection of birds and game, 1908, Palmer.....	455
The use of bacteria in destroying rats, Xylander.....	455
Exterminating field mice with barium carbonate, Hiltner and Korff.....	455
The dissociation of specific characters in hybrids between certain birds, Ghigi..	455
Wild birds, useful and injurious, Archibald.....	456
Some common birds of Oregon, Finley.....	456
The locust plague in Hortobágy in 1907, and birds, Schenk.....	456
A report on <i>Trox suberosus</i> , Ichcs.....	456
The destruction of <i>Melolontha vulgaris</i> , Vivien.....	456
A record of results from rearings and dissections of Tachinidæ, Townsend.....	456
The formation of the colonies of parasitic ants, Viehmeyer.....	457
Annual report for 1907 of the zoologist, Warburton.....	457
Insects of the year 1907, Macdougall.....	457
[Notes on economic zoology], Rörig, Börner, and Moritz.....	457
Report of committee on entomology, Gossard.....	458
Some insect enemies of garden crops, Smith.....	458
The weeviling of maize in West Africa, Newstead.....	458
Sugar-cane borer, Ferreyros.....	458
The tobacco stem borer, Lefroy.....	458
The larvæ of the cabbage butterfly, Paoli.....	458
<i>Plutella cruciferarum</i> , Quanjer.....	458
The blackberry leaf-miner, Houghton.....	458
A new enemy of the strawberry in Germany, Morstatt.....	459
Use of arsenical compounds in the treatment of vineyards, Bertin-Sans and Ros..	459
Combating the olive fly, Berlese.....	459
The cocoanut beetle in Batticaloa, Ceylon, Green.....	459
The more important insects affecting Ohio shade trees, Houser.....	459
Forest injuries from insects, Hanff.....	459
Injury to <i>Abies nobilis</i> by <i>Chermes piceæ bouvieri</i> , Molz.....	459
Some coleoptera affecting the honey locust, Houghton.....	459
Note on the lac insect, its life history, propagation, and collection, Stebbing..	460
The life history of house flies, Griffith.....	460
The bot fly ( <i>Gastrophilus equi</i> ), Froggatt.....	460
The rôle of arthropods in the dissemination of diseases, Galli-Valerio.....	460
Sericultural experiments, Basu Bahadur.....	460
Silk culture and the silk industry in Turkey, Shavrov.....	460

## FOODS—HUMAN NUTRITION.

Food of man studies, Merrill.....	461
Some unusual Japanese food products, Loew.....	461
New Zealand boned beef, Wright.....	461
Brown spots on beef, Klein.....	462
The cuts of a hog carcass, Dinsmore.....	462
Chemical composition of fish with reference to growth and environment, Reuss..	462
Digestibility of milk products, Bruynoghe.....	462
Lard, McGill.....	462
Meat extract and similar preparations, Bigelow and Cook.....	462
Observation on army bread, Bischoff.....	463
Influence of yeast improvers on bread fermentation, Vandeveldt and Masson..	463
Honey, McGill.....	463
The fig, Doggett.....	463
Nuts and their uses as food, Jaffa.....	464
Olive oil and its adulteration, Blavia.....	464

	Page.
On the chemical composition of some Australian wines, Blunno and Musso.....	464
Organic phosphorus in wine, Soave.....	464
Lemon extract, Bryan.....	464
Salicylic acid for preserving fruit juices, Dafert and Haas.....	464
Influence on digestion and health of benzoic acid and benzoates, Wiley.....	464
The social condition of working-class families in Dublin.....	464
Dietetics in tuberculosis: Principles and economics, Bardswell and Chapman.....	464
An explanation of the specific dynamic effect of protein, Lusk.....	464
Effect of gastric and intestinal enzymes on vegetable protein, Stutzer and Merres.....	465
Action of gastric and intestinal enzymes on vegetable protein, Stutzer and Merres.....	465
The utilization of different amid bodies by Carnivora, Völtz and Yakuwa.....	465
The direct utilization of the common sugars by the tissues, McGuigan.....	465
Studies of diastase, Wohlgemuth.....	465
Experiments with children as to mineral metabolism, Cronheim and Müller.....	465
Metabolism of calcium, magnesium, and phosphorus in fasting, Wellmann.....	465
The utilization by the growing animal of calcium, Aron and Frese.....	466
Observations on the rectal temperature after muscular exercise, Flack.....	466

## ANIMAL PRODUCTION.

The composition of green maize and of the silage therefrom, Annett and Russell.....	466
The chemical changes taking place during the ensilage of maize, Russell.....	466
Analyses of a mixture of red clover and timothy, Grégoire and Carpiaux.....	467
On the composition of rice straw, Takeuchi.....	467
Fodders and their nutrient values, Juritz.....	467
Examination of feeding stuffs, Aumann.....	467
Examination of feeding stuffs, Immendorff.....	467
Feeding stuff analyses, Haselhoff.....	467
New feeding stuffs, De Paula Nogueira.....	467
The digestibility of dried beet pulp, Baeck.....	468
The use of olive marc for cattle feeding, Guyader.....	468
Patent horsebread, Morgan.....	468
Beer yeast as a feeding stuff, Pott.....	468
Notes from the chemical laboratories, Ingle.....	468
Concerning spoiled peanut cake, Grégoire, Hendrick, and Carpiaux.....	468
Do ptomaines and toxins occur in animal meal? Haefcke.....	468
[Sex and birth weight of calves], Beach.....	468
Calf raising, Jonas.....	468
Whole milk compared with skim milk in calf feeding, Fingerling.....	468
Feeding of the Angus steer Andy, Boss.....	469
Study of draft oxen in Tunis, Barrion and Gagey.....	469
A dynamometer for experiments with steers, Gagey.....	469
The milk secretion of pigs and the feeding of young pigs, Ostertag et al.....	469
Forage crops for hogs in Kansas and Oklahoma, Quinn.....	469
Potatoes supplemented by protein for pig feeding, Münzinger.....	470
Different quantities of skim milk with supplementary feeds for pigs, Klein.....	470
Construction of pig-sty buildings, Brooks.....	470
Feeding work horses. A comparison of corn and oats, Carmichael.....	470
Saving corn fodder as horse feed.....	470
The metacarpus of carriage and draft horses, Wolter.....	470
Horses—breeding to color, Gilbey.....	470
Feeding experiments with chickens, cockerels, and turkeys, Bolté.....	471
Metabolism of matter and energy during incubation, Tangl and Von Mituch.....	471
The assimilation of phosphorus and calcium by the chicken embryo, Carpiaux.....	472
Carbon dioxid under sitting hens, Edmond.....	472
Incubation experiments, Dryden.....	472
Appliance and methods for pedigree poultry breeding, Pearl and Surface.....	473
Chicks: Hatching and rearing, Nourse et al.....	473
Egg money: How to increase it, Nourse et al.....	473
Experiments with ostriches, Duerden.....	473
Egg-laying records of ostriches, Duerden.....	474

## DAIRY FARMING—DAIRYING.

Experiments in feeding dairy cows, Moore.....	474
Silage, hulls and meal, Risser and Welch.....	475
Modern feeding standards for milch cows, Hanson.....	475
Report of dairy test associations in Norway, 1906-7, Funder.....	475

	Page.
Milk and butter yields of heifers compared with mature cows, Beach.....	475
Milk from different breeds.....	476
Cattle of the Oldenburger Wesermarsch, Cornelius.....	476
Dairying in France, England, Belgium, Denmark, Sweden, and Holland, Reitz..	476
Establishment and management of the dairy farm, Kelkar.....	476
Dairying in the Argentine, MacInnes.....	476
Report of Alnarp Dairy Institute and Agricultural School, 1907.....	476
Handling and marketing of milk and cream, Michels.....	476
The preservation of milk, Eberlein.....	477
On the changes occurring in milk on heating, Jensen.....	477
Investigations on milk serum, Landolf.....	477
"Cieddu," Samarani.....	477
The tubercle bacillus content of milk and milk products sold in Leipzig, Eber..	477
New cream bottle for Babcock test, Mitchell.....	477
Theoretical interpretation of law of Crismer regarding acidity of butter, Gesaro..	477
Renovated butter, Looch.....	477
Report of the Finnish butter exhibits, 1906, Bredenberg and Sandberg.....	477
Report of the Swedish butter exhibits, 1907.....	478
Report of the cheese experiment station at Lodi, Besana.....	478
Chemical study of the ripening of soft cheese, Sanfelici.....	478
On paraffining of cheese and convenient appliances for same, Rosengren.....	478

## VETERINARY MEDICINE.

Annual report of the veterinary department, 1906-7, Stordy.....	478
Piroplasmosis, trypanosomiasis, and rinderpest, Meuleman.....	478
Complication of rinderpest with piroplasmosis, Kowalewsky.....	479
The blood of animals affected with experimental trypanosomiasis, Yakimoff..	479
The biology of the pathogenic organism of hemorrhagic septicemia, Ostertag..	479
Lecithinophilous property of tubercle bacillus and tuberculin, Calmette et al..	479
The etiology of tuberculosis, Ravenel.....	479
Cutaneous and conjunctival tuberculin reaction in cattle, Reinecke.....	480
Report on tuberculosis of domesticated animals.....	480
Dresden method of vaccination of cattle against tuberculosis, Klimmer.....	480
Abortion, Beach.....	480
Diagnosis of chronic mammitis in cows by method of Trommsdorff, Martel..	481
Aphthous pseudostomatitis of cows, Liénaux.....	481
Texas fever, Lewis.....	481
Poisonous symptoms after feeding peanut meal.....	481
The bacillus of Preisz-Nocard in ovine pathology, Carré and Bigoteau.....	481
Gangrenous mammitis in sheep, Pfeiler.....	481
Certain eye diseases among horses, Okholm.....	482
Immunization against glanders, Marxer.....	482
Loco weed poisoning in horses, Peters and Sturdevant.....	482
A protozoan observed in cases of epizootic lymphangitis in mules, Ducloux....	482
Inspection of pork for virulent bacilli of swine erysipelas, Schuh.....	483
A spirochete occurring in blood of chickens in northern India, Montgomery..	483
Streptococcic diseases of fowls, Greve.....	483
Infectious leukemia in ducks, Pound.....	483
A plague affecting canary birds, Zwick.....	483
Local eosinophilia in cases of infections with animal parasites, Fölger.....	484
Notes on some parasites in Burma, Evans and Rennie.....	484

## RURAL ENGINEERING.

Installation of an experimental drainage system, Robertson and Stewart.....	484
Irrigation and drainage, Brown.....	485
Geometrical measuring plate.....	485
Tests of gasoline-operated farm motors.....	485
Plowing by the direct system with motor power, Thallmayer.....	485
Beet diggers, Fischer.....	486
Farm implements in Germany, Dennis.....	486
Strength test of harness leather, Chatburn.....	486
Lighting country homes by private electric plants, Amrine.....	486

## RURAL ECONOMICS.

	Page.
The State and the farmer, Bailey.....	486
Agricultural legislation, Rudloff.....	486
Farm leasing system in New York State.....	487
The subdivision of farms in France, Grandeau.....	487
The exchange and reassignment of land, Grandeau.....	487
The fluctuations in value of agricultural land in France since 1851, Saulnier..	487
The fluctuations in value of agricultural land in France, Zolla.....	487
The farm labor problem.....	488
The white immigrant as a plantation laborer, Behan.....	488
Rural mutual association, Sarazin.....	488
The agricultural cooperative congress at Piacenza, Ottavi.....	488
Agricultural mutual credit banks in 1907.....	488
Agricultural credit banks.....	488
Agricultural credit societies.....	488
The new development in agricultural cooperation, Plunkett.....	488
Credit bank for the encouragement of irrigation works and agriculture.....	488
Crop Reporter.....	489

## AGRICULTURAL EDUCATION.

Report of Committee on Industrial Education in Rural Communities.....	489
Farmers' Institute Report, Miller.....	489
Instruction in practical agriculture at the University farm, Davis, California....	489
Manual of agriculture for the common schools of Illinois, Barto.....	489
Plan for presentation of agriculture for use of teachers, Morgan and Main.....	489
Quantitative analysis for students of agriculture, Lincoln and Walton, Jr.....	489
Dry-land farming: Drought-resistant crops and soil culture, Ten Eyck.....	490
Demonstration problems for Farmers' Institute members, and others.....	490
The poultry industry, Wilson and Lamb.....	490
Nature-study, Holtz.....	490
Our useful birds, Hine.....	490
The story of corn, Breen.....	490

## MISCELLANEOUS.

Nineteenth Annual Report of Connecticut Storrs Station, 1907.....	491
Twenty-first Annual Report of Maryland Station, 1908.....	491
Twenty-first Annual Report of Nebraska Station, 1907.....	491
Twenty-sixth Annual Report of Ohio Station, 1907.....	491
Summary of experiment station work.....	491
How the experiment station can be of service to the farmers of Virginia.....	491
Press bulletins.....	491
Accessions to the Department Library, January-September, 1908.....	491

# LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

## *Stations in the United States.*

	Page.
California Station:	
Circ. 39, Aug., 1908.....	489
Colorado Station:	
Bul. 131, July, 1908.....	452
Connecticut Storrs Station:	
Nineteenth An. Rpt., 1907. 422, 468,	
472, 475, 476, 480, 491	
Hawaiian Sugar Planters' Station:	
Div. Agr. and Chem. Bul. 26,	
1908.....	442

NOTE.—The publications of the United States Department of Agriculture, except those of the Weather Bureau, may be purchased from the Superintendent of Documents, Washington, D. C. For the publications of the Weather Bureau requests and remittances should be directed to the Chief of the Bureau. The price of *Experiment Station Record* is \$1.50 per volume, or 15 cents per number. The prices of other technical publications are given above. The publications of the State experiment stations are distributed from the stations and not from the Department.

# EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, Ph. D., *Assistant Director.*  
Assistant Editor: H. L. KNIGHT.

## EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. BEAL.  
Agricultural Botany and Vegetable Pathology—W. H. EVANS, Ph. D.  
Field Crops—J. I. SCHULTZ.  
Horticulture and Forestry—E. J. GLASSON.  
Foods and Human Nutrition—C. F. LANGWORTHY, Ph. D.  
Zootechny, Dairying, and Agrotechny—E. W. MORSE.  
Agricultural Chemistry—W. H. BEAL, C. F. LANGWORTHY, and E. W. MORSE.  
Economic Zoology, Entomology, and Veterinary Medicine—W. A. HOOKER.  
Rural Engineering—G. A. GRIFFIN.  
Rural Economics—J. B. NORMAN.  
Agricultural Education—D. J. CROSBY.

## CONTENTS OF VOL. XX, NO. 6.

Editorial notes:	Page.
A review of recent progress in agriculture in the United States.....	561
New building of the U. S. Department of Agriculture.....	565
Recent work in agricultural science.....	565
Notes.....	565

## SUBJECT LIST OF ABSTRACTS.

### AGRICULTURAL CHEMISTRY.

A wax acid from soils, Schreiner and Shorey.....	509
Presence of a cholesterol substance in soils—agrostol, Schreiner and Shorey..	509
The Schöns and Appant methods of physical analysis of soils, De Lauchli.....	509
Application of cobalt-nitrate method to soils, Irshel.....	510
Detection of ammonia in water, Lambotte.....	510
The estimation of phosphoric acid in food materials, Ritter.....	510
Determinator the ash content of honey by Lay's method, Schwarz.....	510
The determination of malic acid in food products, Charles, Jr.....	510
The estimation of alcohol in fermented liquids, Antoni.....	510
The determination of cotton-seed hulls in cotton-seed meal, Fraps.....	510
Mitchell Walker moisture test, Mitchell and Walker.....	510
Regarding the methods of investigations of sugar and other late treatment.....	511
Comparison of different methods of estimating the fat content of cream, Koster.....	511
A revolving balance, Wendler.....	511
Determining the energy value of urine, Zaitseck.....	511
Report of food commissioner and chemist, Ladd.....	511
Report of chemical section of Hygienic Institute of Halle, Kistnermann.....	512
[Miscellaneous analyses], Ladd.....	512
Commercial Elettian sugar, Veitch and Howard.....	512
Official and provisional methods of analysis, edited by Wiley.....	512
Proceedings of Association of Official Agricultural Chemists, edited by Wiley.....	512

## METEOROLOGY—WATER.

	Page.
Meteorological elements of the United States and the solar radiation, Bigelow..	513
The moon and the weather, Jochimsen.....	513
Further notes on the difference of temperature between Mt. Royal and McGill Observatory, McLeod and Barnes.....	513
Indications of approaching frost, Strachan.....	514
A two years' study of spring frosts at Williamstown, Mass., Milham.....	514
Monthly Weather Review.....	514
Meteorological observations at Massachusetts Station, Ostrander and Lindblad..	515
[Meteorological observations at North Dakota Station], Ladd.....	515
Report of the director of the [Philippine] Weather Bureau for 1905, Algué..	515
Evaporation from water surface, Ladd.....	515
Rain and run-off near San Francisco, California, Grunsky et al.....	515
Fluctuations in level of the ground water and in the flow of springs, Mezger...	515
Removal of iron from potable waters in Germany and Netherlands, Schweser.	515
Sterilization of drinking water by chemical agents, Labbé.....	515
Sewage and waste waters of industries, Razous.....	515
Rôle of septic tank in biological purification of sewage, Calmette and Rolants..	516
Broad irrigation and intensive biological purification of sewage, Bezault.....	516
The agricultural utilization of sewage, Bechmann et al.....	516
[Sewage irrigation at Pasadena], Wright.....	516
Importance of the agricultural utilization of sewage to industry, Wulsch.....	516

## SOILS—FERTILIZERS.

Soils: Their nature and management, McConnell.....	516
Transported soils with reference to Roman Campagna, De Angelis d'Ossat.....	516
Study of Belgian soils.....	516
Nature of the soils of Morocco.....	517
Report of Adzhibay Experiment Field for 1904 to 1906, Shushak.....	517
On the rate of some phenomena of weathering, Zemyatchenskiï.....	517
Some laboratory experiments on the capillarity of soils, Tulaykov.....	517
Effect of carbon bisulphid on soils and plants, Egorov.....	518
Investigations on nitrification, Coleman.....	518
Nitrification in field experiments, Frankfurt and Duschechkin.....	519
The effect of carbonates upon nitrification, Owen.....	519
Present knowledge of micro-organisms which fix free nitrogen, Palmans.....	520
Utilization of the nitrogen of the air by plants, Jamieson.....	520
Nitrogen fixation for nonleguminous plants, Bottomley.....	520
Do roots assimilate nitrates? Slezkin.....	521
Note on a toxic substance excreted by the roots of plants, Fletcher.....	521
An alleged excretion of toxic substances by plant roots.....	521
The productiveness of the soil: Biological factors, Massart.....	521
Further soil tests in paraffined wire baskets, Hartwell and Pember.....	521
Notes on humus and the best means of supplying it, Guthrie.....	522
Technique of fertilizers, Dumont.....	522
Analyses of commercial fertilizers, Hartwell et al.....	522
Fertilizer experiments.....	522
On the nitrification of certain nitrogenous fertilizers, De Grazia.....	522
The physiological action and fertilizing value of salts of dicyandiamid, Perotti.	522
Properties of calcium cyanamid in relation to water, air, and bacteria, Grandeau.	523
Recent work on calcium cyanamid and its fertilizing value, Grandeau.....	523
Transformation of the nitrogen of calcium cyanamid in soils, Grandeau.....	523
Gaseous products of decomposition of lime nitrogen and growth, Haselhoff...	523
Experiments with lime nitrogen on grain and sugar beets, Von Liebenberg...	523
Experiments with nitrate of lime in comparison with nitrate of soda, De Limay..	523
Cold, the checking of growth, and the use of nitrates, Grandeau.....	523
The manufacture of nitrates, Bazin.....	523
Atmospheric nitrogen as a future commercial source of plant food, Van Slyke..	523
Feldspathic rock as a source of potassium, Hartwell and Pember.....	524
Investigations on the formation of oceanic salt deposits, Van't Hoff.....	524
Natural factors involved in solution of tricalcium phosphate in soil, Perotti...	524
Tests of the use of gypsum as a fertilizer, Dusserre.....	524
Mineral resources of the United States, calendar year 1906, Day et al.....	525
The future of the guano industry and the guano-producing birds of Peru, Coker.	525

	Page.
Production and extraction of guano, Coker.....	525
Utilization of wrack, Swalm.....	525
City household garbage, Danger.....	525
Utilization of household wastes, Bocher.....	525
Apparatus for utilizing dead animals and slaughterhouse refuse, Fränkel et al..	525

## AGRICULTURAL BOTANY.

The physiology of stomata, Lloyd.....	525
Influence of mixture of soluble salts on leaf structure and transpiration, Harter..	527
The value of sodium to plants by reason of its protective action, Osterhout....	527
The protective effect of sodium on plants, Osterhout.....	527
Notes on hydrocyanic acid in some plants, De Jong.....	527
A study of yeasts from California grapes, Holm.....	528
[Report of the] department of botany, Bolley.....	528
Seeds and plants imported from July, 1906, to December 31, 1907.....	528
A catalogue of the poisonous plants of Iowa, Pammel and Fogel.....	528

## FIELD CROPS.

Field experiments, 1907.....	529
Fertilizers for Jerusalem artichokes, Donon.....	529
Tests with different strains of root crops, Helweg.....	529
Variety tests and storage experiments with beets, Sjollema and Van Daalen.....	530
Storage experiments with fodder beets, 1904-1907.....	530
Is it advisable to remove leaves of mother beets when placing in silo? Briem..	530
Dry matter and sugar content of beet and importance in breeding, Plahn...	530
Studies on seed formation in clover and alfalfa, Bolley.....	530
Distance between hills for corn in Illinois corn belt, Hume, et al.....	531
Ten generations of corn breeding, Smith.....	531
Corn: Selection, storing, curing, and testing for seed, Jeffery.....	532
Testing the germination of seed corn, Jones.....	532
The culture of cotton without irrigation, Prétrel.....	533
The flax stem, Tammes.....	533
Trials of hemp, Bolley.....	533
Hop culture and handling, Fruwirth.....	533
A study of the factors influencing the improvement of the potato, East.....	533
Irish seed potatoes in England, 1907.....	535
<i>Solanum commersonii</i> violet and the Blue Giant, Pethybridge.....	535
Dwarf Essex rape for winter forage, Scott.....	535
Ten years' trials with different varieties of rye, Mortensen and Hansen.....	536
The fertilizing value of hairy vetch for Connecticut tobacco fields, Robinson..	536
[Comparative and chemical studies of wheat varieties], Scherffius and Woosley..	536
Some new hybrid wheats, Elliott and Lawrence.....	537

## HORTICULTURE.

A further study of soil treatment in greenhouse culture, Wheeler and Adams..	537
The French garden, McKay.....	538
Orchard cover crops, Thornber.....	538
Fruit marketing investigations in 1907, Higgins.....	538
Cape fresh fruit export trade, season 1908, Chiappini.....	539
Peach, apricot, and prune kernels as by-products of the fruit industry, Rabak..	539
Commercial fertilizer experiments with coffee, Helmrich.....	539
The future of cacao planting, Smith.....	540
Street trees, their care and preservation, Taylor.....	540
The small country place, Maynard.....	540
The preservation of cut flowers, Ducomet and Fourton.....	540
Exploitation of medicinal plants.....	540

## FORESTRY.

Neudamm forestry manual, Schwappach et al.....	541
Forest survey methods, Ross.....	541
Handbook on forest mensuration of the white pine in Massachusetts, Cook.....	541
Fertilizer experiments with pine on high moorland, Von Tubeuf.....	541
Eucalyptus in California, Ingham.....	542

	Page.
Basket willow culture, Mell.....	542
The drifting-sand problem, Gill.....	542
Silvical leaflets.....	542
Exploitation of forests.....	543
First report on a study of forest conditions of Kentucky, Holmes and Bradfield..	543
The management of the provincial forests of d'Amance, Cuif.....	543
Forest administration of the Central Provinces for 1906-7, Gradon et al.....	543
Forest administration in Eastern Bengal and Assam for 1906-7, Tottenham.....	544
Forest administration of the lower provinces of Bengal for 1906-7, McIntire.....	544
Report on the forest administration of Southern Nigeria for 1906, Thompson.....	544
The use of fluorid as a preserving material for wooden poles, Nowotny.....	544
Wood—its products and industrial extracts, Dumesny and Noyer.....	544
Italian camphor, Giglioli.....	544
Rubber extraction.....	545
Ecanda rubber ( <i>Raphionacme utilis</i> ), Stapf.....	545

## DISEASES OF PLANTS.

Plant diseases in 1907, Mortensen, Rostrup, and Ravn.....	545
Trials with the hot-water treatment for six-rowed barley, Ravn.....	545
Wart disease, or black scab, of potatoes.....	545
The root rots of beets, Busse.....	546
The heart rot of sugar beets, Genty.....	546
A mold of latouag wheat, Mangin and Patouillard.....	546
Bean anthracnose, Whetzel.....	546
Some apple leaf-spot fungi, Hartley.....	547
A leaf-spot fungus of the apple, Sheldon.....	547
Apple leaf spot, Chittenden.....	547
<i>Exoascus deformans</i> , Zauli.....	548
American gooseberry mildew.....	548
[Some vine diseases], Bioletti.....	548
Notes on grape downy mildew in 1907, Faes.....	548
Use of proprietary mixtures for control of downy and powdery mildew, Fischer..	548
Effect of some fungicides on the control of downy mildew, Meissner.....	549
Two diseases of prickly pears, Tryon.....	549
The fir disease in Jura, Henry.....	549
A note on <i>Micropera abietis</i> , Fron.....	549
Extent and importance of the white pine blight, Dana.....	549
The blight on chestnut trees, Mickleborough.....	550
Extent and importance of the chestnut bark disease, Hodson.....	550
A disease of the Cineraria, Chittenden.....	550
The occurrence of <i>Rhodochytrium spilanthis</i> in North America, Atkinson.....	550
Bordeaux mixture and other fungicides, Quinn.....	550
Fungicides, Whetzel.....	551

## ECONOMIC ZOOLOGY—ENTOMOLOGY.

Harmful and beneficial mammals of the arid interior, Bailey.....	551
Game laws for 1908, Palmer and Oldys.....	551
Distribution and control of wild rabbits in Mecklenburg, Friederichs.....	551
The destruction of rats, Galli-Valerio.....	552
The use of fluid cultures of mouse typhoid.....	552
The ecological succession of birds, Adams.....	552
The significance of insectivorous birds in agriculture, Bos.....	552
Proceedings of twentieth meeting of Association of Economic Entomologists...	552
Proceedings of the Entomological Society of Washington.....	553
Some features of the work of the State board of entomology, Smith.....	553
Twenty enemies of agriculture, Hnos.....	553
Injurious insects and their destruction, de Malafosse.....	553
Entomological notes, Fuller.....	554
Description of insects and their work. Insecticides, Surface.....	554
Notes on insect pests.....	554
Life histories and larval habits of the tiger beetles, Shelford.....	554
The gum-lac insect of Madagascar, and other coccids in that island, Newstead..	554
On a new genus of Ixodoidea, Nuttall and Warburton.....	554
An agricultural pest in Porto Rico, Bouvier.....	554
<i>Phalacrus corruscus</i> as an enemy of cereal smuts, Friederichs.....	554

	Page.
Erroneous reports of cotton-boll weevil—its present status, Sherman, jr.....	555
Insect pests and diseases of sugar beets in 1907, Fallada.....	555
Fumigation for the citrus white fly, as adapted to Florida conditions, Morrill..	555
Fungus diseases of scale insects and white fly, Rolfs and Fawcett.....	556
The San José scale, Sanderson.....	556
The oyster-shell scale.....	556
Caterpillars injuring apple foliage in late summer, Sanderson.....	556
The apple leaf-aphis, Sanderson.....	557
The gall and root forms of phylloxera, Foà and Grandori.....	557
Grape culture in California: Phylloxera and resistant vines, Bioletti.....	557
The grape leaf-hopper, Quayle.....	557
The California grape rootworm, Quayle.....	558
The effect of sulphur in vineyards upon earwigs and spiders, Molz.....	559
Biological studies on bark beetles, Hennings.....	559
On some Assam Sal ( <i>Shorea robusta</i> ) insect pests, Stebbing.....	559
Development of diptera in the brood chambers of <i>Myelophilus piniperda</i> , Kleine..	559
<i>Chionaspis euonymi</i> , Faucheron.....	559
Injury to <i>Ampelopsis quinquefolia</i> by <i>Spilosoma lupricipeda</i> , Molz.....	559
Nurseries and nursery inspection, Symons, Norton, and Close.....	560
The insect pest law, Herrick.....	560
Comparative study of the value of various insecticides, Truelle.....	560
An apparatus for the preparation of kerosene emulsion, De Bussy.....	560
The etiology of so-called foul brood of bees, Maassen.....	560

## FOODS—HUMAN NUTRITION.

The effects of cold storage on eggs, quail, and chickens, Wiley et al.....	560
Canned salmon, McGill.....	562
Poisonous fish, Heiser.....	562
On the occurrence of copper in oysters, Willard.....	562
Young bees as a delicacy, Takaishi.....	562
Report on dehydrated vegetables, milk, egg, etc., Dent.....	562
Concerning preserved egg yolk, Schoonjans.....	563
Flour bleaching, Snyder.....	563
Causes of the quality strength in wheaten flour, Humphries.....	564
Some considerations determining the strength of flours, Baker and Hulton.....	564
New process of bread making [using cotton-seed meal].....	564
Do macaroons contain hydrocyanic acid? Koch.....	564
Tarragon essence and some of the derivatives of tarragon, Daufresne.....	565
Fecal contamination of fruit and vegetables, Ressel.....	565
Meat and food inspection, Robertson.....	565
Notices of judgment.....	565
Pure food legislation, Heiser.....	565
Federal food laws, II.....	565
Food chemistry in the years 1906 and 1907, Fendler.....	565
The household baker, Doherty.....	565
Cost of living in New Jersey.....	565
Report to the International Congress of 'Alimentary Hygiene, Zuntz.....	566
Maintenance ration at different ages, Maurel.....	566
School diet, Legendre.....	566
The régime and diet of a man engaged in intellectual work, De Fleury.....	566
Chemical problems in hospital practice, Folin.....	566
The excretion of sulphurous acid by man, Franz and Sonntag.....	566
A respiration calorimeter, Letulle and Pompilian.....	566

## ANIMAL PRODUCTION.

Analyses of commercial feeding stuffs, Hartwell, Morgan, and Whipple.....	566
Mealie meal, McEneaney.....	567
[Analyses of] rust affected straw, Ladd.....	567
The adulteration of feeding stuffs, Lemmermann.....	567
Some recent feeding experiments, Hartwell.....	567
Dried beet pulp as a feed for animals, Malpeaux.....	567
Dried pulp as a food for cattle, De Grouhart.....	567
Beef production on high-priced land, Waters.....	568
Experiments with diastasin in the feeding of calves, Haselhoff.....	568

	Page.
Mendelian characters among Shorthorn cattle, Wilson.....	568
Inheritance of coat color in the cattle of East Flanders, Van Damme.....	568
Cattle breeding in Zambi.....	568
Ration experiments with lambs, 1906-7, Morton.....	568
Rational sheep feeding, Mumford.....	569
The general management of sheep, Mansell.....	569
Goat raising, with a description of German and Swiss breeds, Wilsdorf.....	569
Feeds supplementary to corn for southern pork production, Gray et al.....	569
Swine feeding, Willson.....	570
The first farmers' bacon factory in the United Kingdom, Douglas.....	570
Feeding and care of horses, Trowbridge.....	570
Dried potatoes as a food for horses, Parow.....	570
The relation between form and function, Von Nathusius.....	571
Influence of eggshell on metabolism, Tangl and Hammerschlag.....	571
Breeds of poultry described and illustrated, Triefoff.....	571
Preservation of eggs, Prall.....	571

## DAIRY FARMING—DAIRYING—AGROTECHNY.

Cropping systems for New England dairy farms, Dodge.....	571
On the feeding value of alfalfa, Hansen.....	572
Cotton-seed meal and hulls <i>v.</i> cold pressed cake, Lee, jr., and Woodward.....	572
Silos and silage in Maryland, Crisp and Patterson.....	572
Feeding the dairy cow, Eckles.....	572
Investigations on the effect of food fat upon the milk production of cows.....	572
The existence of a lactase in cow's milk, Vandeveld.....	572
On the presence of hemolytic factors in milk, Lane-Clayton.....	573
Effect of heating on determination of leucocytes in milk, Russell and Hoffmann.....	573
A group of lactic-acid bacteria not previously described in America, Hastings.....	573
Bacteria in yoghurt, Klotz.....	573
Yoghurt, Henneberg.....	573
The improvement of the milk supply, Weld.....	573
Necessity for a standard of cleanliness in milking competitions, Howard-Jones.....	574
The history of milk hygiene to the middle of the nineteenth century, Hanauer.....	574
Dairy products in Switzerland in 1907, Leopold.....	574
Report of the Bernese dairy school, Peter.....	574
[Analyses of milk, condensed milk, and butter], McCrae.....	574
Formalin as a preservative in the manufacture of butter and cheese, Eichloff.....	574
Studies on the rational manufacture of Grana cheese, Gorini.....	574
Some essentials in cheese making, Publow.....	574
Defects in American Cheddar cheese, Publow.....	574
Investigations of a severe disease of Gorgonzola cheese, Gorini.....	574
Trials of new dairy appliances, Martiny.....	575
The Dalén and Celsing milking machine.....	575
A practical milk cooler, Gerstenberger.....	575
Unfermented apple juice, Gore.....	575
Improved methods of wine making, Bioletti.....	575
The rôle of malic-acid fermentation in the manufacture of wine, Rosenstiehl.....	576
Artificial refrigeration in enology, Pini.....	576

## VETERINARY MEDICINE.

Animal industry and animal diseases in German Southwest Africa, Rickmann.....	576
Meat inspection and diseases of animals, Cleland.....	576
Public abattoirs a necessity to eradicate consumption, etc., Holder.....	577
The cat: A neglected factor in sanitary science, Osborne.....	577
The relation of the soil to certain diseases, Ludwig.....	577
A theory of natural immunity of living tissue, Holzinger.....	577
Hemolysis and antihemoglobin, Demees.....	577
<i>Bacterium anthracis</i> , anthrax vaccines, and hyperimmunization, Milks.....	577
The application of atoxyl in veterinary medicine, Walther.....	578
Treating rabies with atoxyl, Heymann.....	578
Immunization of mice against rabies through the alimentary tract, Repetto.....	578
The hereditary transmission of immunity to rabies, Remlinger.....	578
Properties of <i>Sterigmatocystis lutea</i> , Sartory and Jourde.....	578
The treatment of trypanosomiasis, Laveran and Thiroux.....	579
Experimental studies on tuberculosis, Levy, Blumenthal, and Marxer.....	579
Tuberculous infection through the alimentary canal, Ravenel and Reichel.....	579

	Page.
Tuberculous infection and the diagnosis of this disease, Arloing and Thévenot..	579
The susceptibility of mammals to tuberculin, Marie and Tiffeneau.....	579
The simultaneous application of tuberculin by the hypodermic, ophthalmic, and cutaneous methods, Selan.....	580
Ophthalmic and cuti-reaction in bovine tuberculosis, Garth, et al.....	580
The cutaneous and conjunctival reaction to tuberculin, Wildbolz.....	580
The specific value of conjunctival reaction to tuberculin, Arloing.....	580
Susceptibility to tuberculosis from tuberculin, Slatineano and Danielopol.....	580
The passage of tubercle bacilli into the milk, Coquot.....	580
The milk of reacting but not clinical cases of tuberculosis in cows, Ostertag...	580
Tubercle bacilli in the milk of tuberculous cows, de Jong.....	581
Frequency of tubercle bacilli in market milk of Washington, D. C., Anderson..	581
Combating tuberculosis by control of dairy by-products, Martel.....	581
Chronic pseudotuberculous enteritis in cattle, Bugge and Albien.....	581
Chronic bronchitis and broncho-pneumonia in cattle, Reisinger.....	581
The Koopmansfontein lamziekte experiment, Spreull.....	581
Method of determining the dose of serum required in rinderpest, Walker.....	581
Enzootic enteritis of calves and serum therapy, Sacchini.....	582
Septic pneumonia of calves, Schreiber.....	582
Stomach worms in calves, Moras.....	582
The warble fly. Experiments on cattle, Carpenter and Steen.....	582
Report on cattle tick in Lincoln and Claiborne parishes, Newell and Mauldin...	582
Studies on Malta fever among Algerian goats in 1907, Sergent et al.....	583
Immunization of swine against hog cholera, Connaway.....	583
Borna horse disease, Liebener.....	583
The introduction of glanders with English horses, Bang.....	583
A preliminary report on some diseases of chickens, Milks.....	583
The action of the aggressin of fowl cholera, Weil.....	584
Fowl plague with special reference to its pathological anatomy, Freese.....	584
Studies and micro-photographs of the pathogenic protozoa, von Wasielowski..	584
Animal parasites, Perroncito.....	584

## RURAL ENGINEERING.

Road materials of southern and eastern Maine, Leighton and Bastin.....	585
Specifications and notes on macadam road construction, Johnson.....	585
Macadam roads, Fletcher.....	585
Highway improvement in Vermont, Gates.....	586
Dust preventives, Hubbard.....	586
Irrigation in Mexico.....	586
Yuma irrigation dam, Willey.....	586
A new scraper excavator.....	586
The applications of the motor in agriculture.....	586
Traction motors.....	586
Traction culture machines, Frémier.....	587
Statistics of agricultural implements.....	587
Hydro-electric plants, Ringlemann.....	587

## RURAL ECONOMICS.

The results of investigations on the returns in agriculture.....	587
Investigations concerning agricultural profits in Switzerland, Bonhomme.....	587
Finnish agriculture, Borchardt.....	587
Agriculture in Portugal, de Melho.....	587
Agricultural Hungary.....	588
Agricultural labor in Hungary, Bernard.....	588
The agricultural labor problem, von Kahlen.....	588
The wages of agricultural laborers in Bohemia, Hergel.....	588
Agricultural holdings bill, 1908.....	588
The legal status of agricultural cooperative societies, Worms.....	588
Purpose of law relating to agricultural cooperative societies, Naquet.....	588
First fruits of cooperation in India, Wolff.....	589
Cooperative credit in Bengal.....	589
Agricultural credit, Carnaroli.....	589
Immigrants of the agricultural class in the Northwest Provinces, Blue.....	589
Government crop reports. Their value, scope, and preparation, Clark.....	589
Crop Reporter.....	589
Farm bookkeeping, Lamb.....	589

## AGRICULTURAL EDUCATION.

	Page.
Agriculture in the rural schools, Chisholm.....	589
What can the public schools do to improve industrial conditions? Warren....	590
The future of agricultural education in Michigan, Howe.....	590
Form of organization for movable schools of agriculture, Hamilton.....	590
Report on the organization of forestry instruction in Sweden, Wallmo et al....	590
Royal Horticultural School, Dahlem, Kochs.....	590
Missouri Housekeepers' Conference Association.....	590
Report of the committee on children's gardens for the year 1907, Adams.....	590
Importance of school gardens and methods of proper management, Emerson...	590
School gardens, Corbett.....	591
School gardens, Carter, jr.....	591
Possibilities for the teaching of household arts in the rural schools, Pincomb...	591
Teaching soils in the public schools, Carter, jr.....	591
Agriculture in public schools, de Witt.....	591
One hundred experiments in agriculture for California schools, Johnson.....	591
Experimental studies of plant growth, Davis.....	591
Sheep, Kinzer.....	591
Study of birds and their economic value, Finley.....	591
The preparation of the seed bed, Shoesmith.....	592
Some nature biographies, Ward.....	592
The garden book for young people, Lounsberry.....	592
Making hay, Ten Eyck.....	592
Weeds, Davis.....	592

## MISCELLANEOUS.

Eighteenth Annual Report of North Dakota Station, 1907.....	592
A circular of information concerning the New Hampshire Station.....	592
Publications of the Rhode Island Station available for distribution May 1, 1908.	592
Experiment Station Work, XLVIII.....	592

# LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

## *Stations in the United States.*

	Page.
Alabama College Station:	
Bul. 143, July, 1908.....	569
California Station:	
Bul. 195, July, 1908.....	558
Bul. 196, July, 1908.....	542
Bul. 197, July, 1908. 528, 548, 557, 575	
Bul. 198, July, 1908.....	557
Florida Station:	
Bul. 94, July, 1908.....	556
Bul. 95, Aug., 1908.....	535
Georgia Station:	
Bul. 81, Sept., 1908.....	519
Hawaii Station:	
Press Bul. 21.....	538
Illinois Station:	
Bul. 126, July, 1908.....	531
Bul. 127, Aug., 1908.....	533
Bul. 128, Sept., 1908.....	531
Kentucky Station:	
Bul. 135, June, 1908.....	536
Louisiana Stations:	
Bul. 108, Aug., 1908.....	583
Bul. 109, Aug., 1908.....	577
Bul. 110, Sept., 1908.....	572
Maryland Station:	
Bul. 129, July, 1908.....	572
Bul. 130, Aug., 1908.....	560
Massachusetts Station:	
Met. Buls. 237-238, Sept.-Oct., 1908.....	515
Michigan Station:	
Circ. 3, Aug., 1908.....	532
Minnesota Station:	
Bul. 111, Aug., 1908.....	563
Mississippi Station:	
Circ., June, 1908.....	560
Missouri Station:	
Circ. Inform. 24.....	567
Circ. Inform. 25.....	569
Circ. Inform. 26.....	572
Circ. Inform. 27.....	570
Circ. Inform. 28.....	570
Circ. Inform. 29.....	583
Circ. Inform. 30.....	590
New Hampshire Station:	
Bul. 139, July, 1908.....	556
Circ. 3, Aug. 1, 1908.....	557
Circ. 4, Aug., 1908.....	556
Circ. 5, Aug. 25, 1908.....	556
Circ. 6, Sept., 1908.....	592
New York Cornell Station:	
Bul. 255, May, 1908.....	546
Bul. 256, June, 1908.....	540
Bul. 257, Aug., 1908.....	574
Circ. 1, Mar., 1908.....	532
Circ. 2, Mar., 1908.....	551
Circ. 3, May, 1908.....	574
North Dakota Station:	
Eighteenth An. Rpt. 1907, pt. 1. 512, 515, 528, 530, 533, 567, 592

Crop Reporter, vol. 10, No. 12, Sup., Dec., 1908.....	589
Weather Bureau:	
Monthly Weather Review, vol. 36, Nos. 7-8, July-Aug., 1908 (20 cents per number, \$2.50 per year).....	514
Office of Experiment Stations:	
Circ. 79.....	590
Office of Public Reads:	
Bul. 33 (20 cents).....	585
Bul. 34 (15 cents).....	586

# EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, PH. D., *Assistant Director*.  
Assistant Editor: H. L. KNIGHT.

## EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. BEAL.  
Agricultural Botany and Vegetable Pathology—W. H. EVANS, Ph. D.  
Field Crops—J. I. SCHULTE.  
Horticulture and Forestry—E. J. GLASSON.  
Foods and Human Nutrition—C. F. LANGWORTHY, Ph. D.  
Zootechny, Dairying, and Agrotechny—E. W. MORSE.  
Agricultural Chemistry—W. H. BEAL, C. F. LANGWORTHY, and E. W. MORSE.  
Economic Zoology, Entomology, and Veterinary Medicine—W. A. HOOKER.  
Rural Engineering—G. A. GRIFFIN.  
Rural Economics—J. B. MORMAN.  
Agricultural Education—D. J. CROSBY.

## CONTENTS OF VOL. XX, NO. 7.

	Page.
Editorial notes:	
The Commission on Country Life and its report .....	601
The obligations of our agricultural institutions in relation to rural betterment.....	605
The First Pan-American Scientific Congress .....	608
Recent work in agricultural science.....	609
Notes.....	694

## SUBJECT LIST OF ABSTRACTS.

### AGRICULTURAL CHEMISTRY.

Annual reports on the progress of chemistry for 1907.....	609
General chemistry of enzymes, Euler.....	609
The data of geochemistry, Clarke.....	609
The equilibrium of ammonia under pressure, Haber and Le Rossignol.....	609
On the equilibrium weights of ammonia, Jost .....	610
On the constitution of phosphoric acid, Palazzo and Maggiacomo.....	610
The determination of phosphoric acid, von Lorenz.....	610
The determination of phosphoric acid by the von Lorenz method, Fallada.....	610
Action of ammonium citrate on calcium phosphate, Barillé.....	610
A simple method for the determination of potash in silicates, Autenrieth.....	610
A short volumetric method for the estimation of sulphuric acid, Cooksey.....	610
Mechanical and physico-chemical analysis of soil, Hiti .....	610
The estimation of phosphoric acid in foods, Wörner .....	610
The detection of pentoses by means of orcin hydrochlorate, Pieraerts.....	611
Detection and estimation of rice husk in feeding stuffs, Schröder.....	611
The proteins of egg yolk, Plimmer .....	611
The albumen of turkey egg white, Worms .....	611
The detection of protein by means of formaldehyde, von Liebermann .....	611
Identification of different plant proteids by specific sera, Gasis .....	611
The estimation of dry matter in gluten, Neumann and Salecker .....	611

	Page.
Saccharid substances, Silz.....	611
The inversion of cane sugar by invertase, Hudson.....	611
Detection of $\delta$ -fructose in the presence of other natural sugars, Pieraerts.....	611
The estimation of sugar in beet stalks and dried pulp, Robart.....	612
A reaction for the detection of natural and artificial honey, Fiehe.....	612
The rapid estimation of starch in sausage and other meat products, Telle.....	612
Detection of horse meat in sausage, etc., Telle.....	612
Methods employed for the analyses of wines, alcohols, brandy, and liqueurs.....	612
New method for determination of acids in fermented beverages, Pozzi-Escot.....	612
Citric acid in wine, Hubert.....	612
Note on the formation of formaldehyde in solutions of cane sugar, Ramsay.....	612
Titration of formaldehyde in colored solutions, Sørensen and Jessen-Hansen.....	612
The detection of formaldehyde, von Fillinger.....	612
Estimation of boric, salicylic, and benzoic acid, von Genersich.....	612
The detection of saponin, Rühle.....	612
The valuation of saffron for dairy purposes, Teichert.....	612
The preservation of milk samples for analytical purposes, Windisch.....	613
Rapid estimation of potassium bichromate in milk, Gouère.....	613
Studies on the Adams method of estimating fat, Eichloff.....	613
An automatic device for measuring reagents used in the Gerber method.....	613
A new automatic milk-measuring device, Wendler.....	613
New apparatus for estimating the moisture content of butter.....	613
Total solids in mill products by the refractometer, Peck.....	613
Refractometer in the control of sugar manufacturing processes, Strohmmer.....	613
A new soil sampler, Stevenson.....	613

## METEOROLOGY—WATER.

The weather service and meteorology in the United States and Canada, Polis.....	614
Third annual report of the meteorological committee.....	614
The daily normal temperature and precipitation of the United States, Bigelow.....	614
Monthly Weather Review.....	614
Meteorological statistics for 1907, Loud.....	615
Climate [of Maryland], Clark and Mathews.....	615
The meteorological service and the climate of São Paulo, Belfort Mattos.....	615
The weather of 1907 at the Midland Agricultural and Dairy College.....	615
Dew measurements during 1904 to 1907, Passerini.....	615
Report of station of agricultural climatology of Juvisy, 1907, Flammarion.....	615
Study of the climate of Rennes, Cloarec.....	616
Meteorological observations at Ploti Station, 1907, Boulatovitch and Winkler.....	616
Report of meteorological commission [Cape of Good Hope], 1907, Smith et al.....	616
A comparison of the rainfall of Sydney and Melbourne, 1876-1905, Duckworth.....	616
Artesian water supply of Australia with reference to Gregory's theory, Pittman.....	616
Chlorin and solid matter in river water, Sack.....	616
The decomposition and nitrification of sewage, Purvis and Courtauld.....	616
Royal Commission on Sewage Disposal, Shenton.....	617
Royal Commission on Sewage Disposal.....	617

## SOILS—FERTILIZERS.

Bibliography of the geology of Connecticut, Gregory.....	617
The distribution and location of moors in Germany, Krische.....	617
Agrologic study of an estate by the method of J. Hazard, Grégoire and Halet.....	617
Agronomic charts, Lepplae.....	618
The agronomic chart of Belgium and analyses of soils, Lepplae.....	618
Agronomic charts, Grégoire and Halet.....	618
Agronomic charts, Proost.....	618
The study of soils.....	618
Agrological studies, Rebello da Silva.....	618
The use of geo-agrological maps in the assessment of taxes in Verona, Nicolis.....	618
Analyses of soils from Papua, Guthrie and Symmonds.....	618
Soil analysis as applied to forestry, Vater.....	618
Causes of the dying out of artificial forest plantings in the steppes, Kravkov.....	618
Regarding certain so-called physical properties of soil, Ehrenberg.....	619
On physical properties of soils, Rodewald.....	619
Note on a flowing (melting) soil, Grégoire.....	619
The lines of flow of water in saturated soils, Richardson.....	619

	Page.
The relation of soils to the formation of ground water, Mezger.....	619
Soil wastage, Chamberlin.....	619
Soil temperature investigations, Hecker.....	619
Observations and researches in soil temperature, De Grazia.....	620
Fixation of atmospheric nitrogen by leguminous plants, Passon.....	620
Cross-inoculation of leguminous plants with tubercle bacteria, Nobbe et al.....	620
Nitrogen in dead forest cover, Henry.....	620
The influence of bacteria on evaporation from soils, Stigell.....	620
The behavior of soil organisms in solution and in soils, Stevens et al.....	620
Nitrification in acid soils, Hall, Miller, and Gimingham.....	621
Nitrogen-fixing bacteria, III, Löhnis and Pillai.....	621
On dicyandiamid bacteria, Perotti.....	622
A review of the bacteriology of ammonium compounds, Ehrenberg.....	622
The fixation of ammoniacal nitrogen by zeolites in soils, Pfeiffer et al.....	622
Action of ammoniacal nitrogen under the influence of lime, Pfeiffer et al.....	622
The effect of ammonium sulphate and nitrate of soda, Löhnis and Blobel.....	623
Ammonium sulphate and nitrate of soda, Löhnis and Blobel, trans. by Koning.....	623
The utilization of nitrogen in the form of ammonium nitrate, Pfeiffer et al.....	623
Lime nitrogen, nitrogen lime, and lime niter, Sjollem and De Ruijter de Wildt.....	623
Fertilizer experiments with nitrogen lime for potatoes, Stutzer.....	624
Fertilizer experiments with lime niter on tobacco and tomatoes in 1907, Stutzer.....	624
Experiments in manuring wheat with calcium nitrate, Paris.....	624
Utilization of atmospheric nitrogen in production of calcium cyanamid, Frank.....	624
Phosphate deposits of Algeria and Tunis.....	624
Phosphate production in Algeria and Tunis, 1907.....	625
Composition and value of sugar beet vinasse, Verbièse and Darras-Verbièse.....	625
Commercial fertilizers, Burd.....	625
Analyses of commercial fertilizers and Paris green, Halligan et al.....	625
Analyses and valuations of commercial fertilizers, Cathcart et al.....	625
Analyses of fertilizers collected by commissioner of agriculture during 1908.....	625

## AGRICULTURAL BOTANY.

Experiments in the nutrition of plants, Petit.....	625
Investigations on the localization of saccharose in sugar beets, Peklo.....	626
The osmotic properties of the root hairs of certain salt-marsh plants, Hill.....	626
Action of compressed gas on activity of micro-organisms and ferments, Foa.....	626
The effect of dialysis on vegetable rennets, Gerber.....	627
Arsenic in vegetation exposed to smelter smoke, Swain and Harkins.....	627
Effect of illuminating gas and ethylene on carnations, Crocker and Knight.....	627
The viability of seeds, Thornber.....	628
On the longevity of seeds, Ewart.....	628
Methods and causes of evolution, Cook.....	629
The present state of knowledge of heredity in <i>Pisum</i> , Lock.....	629

## FIELD CROPS.

The revegetation of overgrazed range areas, Sampson and Coville.....	629
Deep fall plowing and the seed bed, Knapp.....	630
Electricity in agriculture, Lodge.....	630
Duty of water, True.....	631
American dry farming, Strawbridge.....	632
[Agriculture in the Congo Free State], Pynaert.....	632
[Experiments with field crops], Kilgore et al.....	633
Rotation experiments with cotton, corn, cowpeas, and oats, Dodson.....	634
Grain without irrigation, True.....	634
The systematic classification and naming of grain varieties, von Rümker.....	634
Alfalfa, Westgate.....	634
Alfalfa investigations, Dinsmore.....	634
Data for the international commission for the improvement of barley.....	635
A new basis for barley valuation and improvement, Mann.....	635
The Mendelian and De Vriesian laws applied to cotton breeding, De Loach.....	636
Reappearance of a primitive character in cotton hybrids, Cook.....	636
British cotton cultivation, Dunstan.....	636
Cotton production, 1907, Stenart and Roper.....	636
Flax experiments, 1906.....	636

	Page
Jute and jute substitutes from West Africa .....	637
Report on field trials on varieties of mangel .....	637
Origin of the cultivated potato and bud variations of wild solanums, Heckel ..	637
The dry matter and starch content of potatoes, Hals .....	637
Barnyard manure and commercial fertilizers for potatoes, 1904-1907, Christie ..	638
[Trials with sugar beets and potatoes] .....	638
Experiments on the defoliation of sugar beets, Strohmer, Briem, and Fallada ..	638
Beet sugar, Elkin .....	639
Experiments with canes in the Leeward Islands in 1906-7, Watts et al .....	639
Manurial experiments with cane in Leeward Islands in 1906-7, Watts et al ..	639
Report on field trials on varieties of swedes .....	640
Report on field trials on manuring of swedes .....	640
Propagation of tobacco in Cuba, Baker .....	640
Tobacco .....	640
The perennial sow thistle and some other weed pests of 1908, Howitt .....	640

## HORTICULTURE.

Forcing plants by warm baths, Molisch .....	640
Distribution of seeds and plants, Wickson and Mansell .....	641
Ginseng and other medicinal plants, Harding .....	641
Orchard fruits in the Piedmont and Blue Ridge regions, Gould .....	641
Orchard report of Baton Rouge Station .....	642
[Reports of the fruit experiment stations], Hutt et al .....	642
Fruit culture, Gomes do Carmo .....	642
Influence of peat mull on root development of young fruit trees, Yunge .....	642
May weather and fruit harvests, Hall .....	642
Investigations on the life activities of stored fruits, Schneider-Orelli .....	642
Seedless grapes and orchard fruit, Müller-Thurgau .....	642
Fertilizer experiments with grapes, Zacharewicz .....	642
Viticulture in the department of Constantine, Perruchot .....	642
Coffee, Rangel .....	643
Cacao, Monteiro .....	643
In defense of chestnut groves, Giglioli .....	643
Pecans and other nuts in Texas, Milner .....	643
Budding new tops on pecan trees, Hume .....	643
Shade trees, Start, Stone, and Fernald .....	643
Shade trees for North Carolina, Ashe .....	643
Gardens old and new, edited by Tipping .....	644
Gardening for women, Wolseley .....	644
Window gardening, Dorner .....	644
Water lilies and how to grow them, Conard and Hus .....	644

## FORESTRY.

Douglas fir: Pacific Coast and Rocky Mountain forms, Frothingham .....	644
The pine: Economic and statical investigations, Schwappach .....	644
Production and consumption of basket willows in the United States, Mell .....	645
Forest economics—silviculture, Grandeau .....	645
On the preservation of seeds of deciduous trees, Vanderbisse .....	645
On the combating of hardpan by cultural methods, von Lorenz .....	645
The principles of spacial arrangement in forests, Wagner .....	645
Report of director of forestry of Philippine Islands for 1907, Ahern et al .....	646
Report of the conservator of forests, Legat .....	646
The Bavarian forestry administration and its historical development, Keiper ..	646
Report on the history of the woodlands of the town of Ettlingen, Seeger .....	646
Scientific forestry, forest zoology, and forest botany for 1907, Weber .....	646

## DISEASES OF PLANTS

Observations on the biology of <i>Botrytis cinerea</i> , Brooks .....	646
The physiology and development of some anthracnoses, Edgerton .....	647
On the specialization of a form of <i>Sphaerotheca humuli</i> , Steiner .....	647
The bud rot of carnations and silver top of June grass, Stewart and Hodgkiss ..	647
The smuts of cereals, their distribution and control, Falek .....	648
Rust in wheat, Biffen .....	648
Bean diseases in 1908, Querner .....	648

	Page.
The more important diseases of cabbage in Holland, Quanjer.....	648
Corky scab of potatoes.....	649
Black scab in potatoes.....	649
An important new potato disease in Germany, Schneider.....	649
The occurrence of <i>Chrysophlyctis endobiotica</i> in Westphalia, Spieckermann.....	649
Investigations of diseases of potatoes and root crops during storage, Ravn.....	649
Fire blight in fruit trees, Mack.....	649
The leaf browning of sweet cherries in Germany, von Tubeuf.....	649
Effect of copper preparations and other fungicides on the grape, Molz.....	649
Gum disease of citrus trees in California, Smith and Butler.....	650
<i>Phoma abietina</i> , a parasitic disease of the fir, Mer.....	650
The leaf cast of white pine, von Tubeuf.....	651
A note on the mildew of oaks, Griffon and Naublane.....	651
Mildew of oaks, Boudier.....	651

## ECONOMIC ZOOLOGY—ENTOMOLOGY.

Report on economic zoology for the year ending April 1, 1907, Theobald.....	651
The faunal affinities of the prairie region of Central North America, Ruthven..	651
The commoner birds of our gardens; their habits and foods, Hooper.....	652
The birds of Maine, Knight.....	652
Bibliography of Canadian zoology for 1906, Whiteaves.....	652
Bibliography of Canadian entomology for the year 1906, Bethune.....	652
Uniform common names for insects, Burgess.....	652
American insects, Kellogg.....	652
Forest entomology, Gillanders.....	652
Proceedings of twentieth meeting of Association of Economic Entomologists..	652
Report of sixth meeting of American Association of Horticultural Inspectors..	653
Twenty-third report of State entomologist of New York, 1907, Felt.....	653
Injurious insects, García.....	653
Entomological notes, Gurney.....	654
Imported insect pests, Lefroy.....	654
Report of the entomologist, Simpson.....	654
Effects of spraying with arsenical solutions for locust destruction, Ingle.....	654
The codling moth, Howard.....	654
Woolly aphid and tobacco extract, Lounsbury.....	654
The apple sawfly ( <i>Hoplocampa</i> ( <i>Tenthredo</i> ) <i>testudinea</i> ).....	655
The fruit fly parasite, Newman.....	655
The San José scale in Arkansas, Adams.....	655
Report of the viticultural station and phylloxera service during 1907.....	655
The European elm scale ( <i>Gossyparia spuria</i> ), Doten.....	655
Observations on the genus <i>Contarinia</i> , Felt.....	655
Notes on preparatory stages of some Canadian lepidoptera, Fletcher and Gibson..	656
Upon the life cycle of <i>Phylloxera quercus</i> , Bonfigli.....	656
Notes on <i>Trogoderma tarsale</i> , Houghton.....	656
Saxon forest pest, Hurst.....	656
Is it wise to dip nursery stock? Hall.....	656
Insecticide materials and their application, Smith.....	656
Analyses of Paris green and lead arsenate, Cathcart.....	656
On six new species of Ixodidae, Cooper et al.....	656
The habits, life cycle, and breeding places of the common house fly, Newstead..	657
Flies as carriers of contagion in yaws, Robertson.....	657
Bee pirates, Mally.....	657
Some information on silkworm culture in the Philippine Islands, Schultze.....	657

## FOODS—HUMAN NUTRITION.

Report of the State food commissioner of Illinois, 1907, Jones.....	657
Milk and milk products, water, foods, and condiments, Aumann.....	657
Food laws in the United States, Neufeld.....	657
Ohio general food and drug law, Dunlap.....	657
Labels and rulings, Ladd.....	658
Progress in the chemistry of food and condiments in 1907, Kuttner-Keuler.....	658
The effect of certain preservatives on chopped meat, Mezger and Fuchs.....	658
Lard from oily hogs, Richardson and Farey.....	658
Examination of sausages and their hygienic preparation, Savage.....	658

	Page
The occurrence of monaminic acids in meat extract, Micko.....	658
A study of the extractive material of fish flesh, Suwa.....	658
Preparing preserved crabs without boric acid, Buttenberg.....	658
Judging preserved egg yolk, Brüning.....	658
Note on a sample of preserved egg yolk, Schoonjans.....	658
Influence of heat on the lecithin-phosphoric acid content of egg pastes, Ludwig.....	658
Paste goods containing eggs, Witte.....	658
Determining the baking quality of flour, Renner.....	658
Determining the volume of bread, Neumann and Salecker.....	659
Experiments with special bread made from the entire grain, Strunk.....	659
Concerning bread facilities, Bischoff.....	659
Helianthus tubers, a new vegetable, Kroeber.....	659
A sample of Chinese soy, Herlant.....	659
Chemical study of a sugar-yielding grass, Perrot and Tassilly.....	659
The endo- and ektoinvertase of the date, Vinson.....	659
Sulphurous acid content of California dried fruit, Prstibytek.....	660
Composition of some fruit juices and alcohol fruit extracts, Chauvin et al.....	660
J. Halmi's study of Hungarian fruit juices, Plahl.....	660
Examination of currant juice, Van West.....	660
Examination of lemon juice, Devin.....	660
The declaration of marmalades, fruit juices, and other fruit products, Beythien.....	660
Marmalades, Härtel.....	660
The occurrence of arsenic in marmalades, Rupp.....	660
The effect of color on the composition of cider during fermentation, Andouard.....	661
Extract material of cider, Andouard.....	661
Quality and composition of Charente wine, Guillon.....	661
White wine which has been decolorized, Orlanges.....	661
Citric acid and natural wines, Astruc.....	661
Caffein-free coffee, Scheringa.....	661
Caffein-free coffee, Lendrich and Murdfield.....	661
Hibiscus seeds as coffee adulterant, Chiappella.....	661
Examination of teas on sale in Turkestan, Karpow.....	661
The composition of Horlick's malted milk, Richmond and Musgrave.....	661
Medicinal foods.....	661
Book of recipes (the auto-cook).....	661
Cheap food.....	661
Relation of nutrition investigations to home economics, Langworthy.....	661
The physiology of digestion and nutrition, Cohnheim.....	662
Food problems, Rubner.....	662
Appetite from a theoretical and practical standpoint, Sternberg.....	662
Concerning work of digestion, Heilner.....	662
The rôle of digestive juices in metabolism, London.....	662
Metabolism experiments on the protein requirement of the child, Lungwitz.....	662
Diminished muscular activity and protein metabolism, Shaffer.....	662
The identity of novains with carnitin, Krimberg.....	663
The relation of oblitin to carnitin, Krimberg.....	663
Experiments on a maize diet. Some properties of zein, Baglioni.....	663
Concerning the digestion of fat in the animal body, Levites.....	663
The action of gastric juice on starches, Roger and Simon.....	663
Experiments on carbohydrate metabolism, Johansson.....	663
The influence of mineral matter in the formation of the tissues, Gaube.....	663
The action of chocolate and coffee on renal excretion, Fauvel.....	664
On the duration of rest after eating, Hallepeau.....	664

## ANIMAL PRODUCTION.

Digestion experiments with native hay, Dinsmore and Kennedy.....	664
Feeding for meat production, Armsby.....	665
The relation of steer feeding to farm economics, Quereau.....	665
Steer feeding experiments, Burns.....	666
Grazing experiments in a coyote-proof pasture, Jardine and Coville.....	666
[Experiments with lambs and swine], True.....	667
Pig-feeding experiments, Linfield.....	667
Some poultry experiments, Mairs.....	667
The molting of fowls, Rice, Nixon, and Rogers.....	668
	670

## DAIRY FARMING—DAIRYING.

	Page.
Home-grown rations in economical production of milk and butter, Price.....	672
Records from Indiana dairy herds, Hunziker et al.....	673
The university herd; management and records, 1907-8, Humphrey and Woll.....	674
Changes of bacterial flora of milk during so-called incubation period, Wolff ..	674
Effect of pasteurization on the ammonia in milk, Whitman and Sherman.....	675
Chemical evidence of peptonization in milk, Colwell and Sherman.....	675
A study of moisture in butter, McKay and Bower.....	676
Proteolytic changes in the ripening of Camembert cheese, Dox.....	677
Paraffining butter tubs, Rogers.....	678
Officials, organizations, and institutions connected with dairy interests, 1908..	678

## VETERINARY MEDICINE.

Report of the department of veterinary science and bacteriology, 1907, Mack..	678
Reports of proceedings under the diseases of animals acts, etc., for 1907.....	679
Report of the principal veterinary surgeon, Gray.....	679
Report of the principal veterinary surgeon, Gray.....	679
Report of the government veterinary bacteriologist, Theiler.....	679
Report of the government veterinary bacteriologist, Theiler.....	680
Investigations of bovine and human viruses, Cobbett and Griffith.....	681
The tuberculosis problem, Ward and Haring.....	681
Infection through the gastrointestinal canal, Oberwarth and Rabinowitsch...	681
The penetration of the intestinal wall by tubercle bacilli, Herman.....	682
Split products of the tubercle bacillus and their effects, Vaughan and Wheeler..	682
Vaccination against tuberculosis with bovovaccine, Russell and Hoffmann...	682
Persistence of tuberculin in body of goat, Slatineano and Jonesco-Mihaiesti..	683
Osteoporosis in animals, Ingle.....	683
Note on occurrence in America of chronic bacterial dysentery of cattle, Pearson..	684
Texas fever, Francis.....	684
Swamp fever, Charlton.....	684
The artificial impregnation of mares, Van Meldert.....	685
Pathological investigations of fowl cholera, Jungklaus.....	685
Experiments in transmission of spirillosis of fowls by <i>Argas reflexus</i> , Shellack ..	685
On the penetration of eggs by bacteria, Cao.....	685
Friedberger and Fröhner's veterinary pathology, Hayes.....	685
Index-catalogue of medical and veterinary zoology, Stiles and Hassall.....	685
Observations on the veterinary schools in Europe, Fish.....	685

## RURAL ENGINEERING.

Progress in drainage, Elliott.....	686
Practical farm drainage, Elliott.....	686
Losses of irrigation water and their prevention, Teele.....	686
Irrigation in southeastern Australia.....	686
Irrigation and seepage experiment.....	687
Physical tests of Iowa limes, Beyer.....	687
Modern silo construction, Davidson and King.....	687
How to build a stave silo, Rawl and Conover.....	688
[A new pea and bean thresher], Quereau.....	688
Electricity in agriculture, Cherry.....	688

## RURAL ECONOMICS.

The agricultural and transportation industries, Lambert.....	688
The position of agriculture from the economic point of view, Vibrans.....	688
Note on agriculture in Japan, Nicholson.....	688
Agriculture in Japan, Nicholson.....	689
Cooperative farming, Bulstrode.....	689
The significance of agricultural cooperative associations in Germany, Grabein ..	689
Land and agricultural banks in European countries, Eckerbom.....	689
The farm help problem, Potter.....	689
[Agricultural labor conditions in Germany].....	689
How can the scarcity of German agricultural laborers be prevented? Kayser ..	689
Is the agricultural laborer in East Prussia a proletarian? Hoffmeister.....	690
Agriculture, horticulture, feeding stuffs, Grandeau.....	690

	Page.
Imports of farm and forest products, 1905-1907 .....	690
Exports of farm and forest products, 1905-1907 .....	690
Crop Reporter.....	690
Agricultural statistics of Ireland, with detailed report for 1907, Adams.....	690

## AGRICULTURAL EDUCATION.

Progress in agricultural education, 1907, Crosby.....	691
Statistics of land-grant colleges and experiment stations, 1907, Spethmann.....	691
Statistics of educational institutions, 1904-5.....	691
A successful agricultural high school.....	691
Crookston School of Agriculture, Robertson.....	691
For the promotion of the culture and uses of fruit.....	691
School gardening in the province of La Union, Foreman.....	691
Boys' corn growing contest, Jordan.....	691
With a prosperity train in Georgia, Ball.....	691
The farmers' institutes in the United States, 1907, Hamilton.....	691
Agricultural education through rural schools, Sanderson.....	692
The need of technical education in our public schools, Gibbs.....	692
Agricultural education in the schools, Butterfield.....	692
The rural school and its relation to the community and agriculture, Butterfield.....	692
Elementary principles of agriculture, Ferguson and Lewis.....	692
Plowing and harrowing, Goodrich.....	692
Soil studies, Taylor.....	692
Seeds and seedlings, Brooks.....	692
What trees do, Lazenby.....	692

## MISCELLANEOUS.

Annual Report of the Office of Experiment Stations, 1907.....	693
Annual Report of Nevada Station, 1907.....	693
Bulletins of Alabama College Station.....	693
Index to papers relating to plant-industry subjects in the Yearbooks, Rockwell.....	693
Classified list of available publications of the Bureau of Animal Industry.....	693
A primer of conservation, Cleveland, jr.....	693
Declaration of Governors for conservation of natural resources.....	693

# LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

<i>Stations in the United States.</i>		<i>Stations in the United States—Continued.</i>	
Alabama College Station:	Page.	Tennessee Station:	Page.
Index, 14 (1906), 15 (1907)....	693	Bul. 79, June, 1908 .....	665, 688
Arkansas Station:		Bul. 80, June, 1908 .....	672
Bul. 102, 1908 .....	655	Texas Station:	
California Station:		Bul. 110, Sept., 1908 .....	666
Bul. 199, Aug., 1908 .....	681	Bul. 111, Sept., 1908 .....	684
Bul. 200, Aug., 1908 .....	650	Wisconsin Station:	
Bul. 201, June 30, 1908 .....	625	Bul. 165, Nov., 1908 .....	682
Seed Bul., 1908-9 .....	641	Bul. 167, Sept., 1908 .....	674
Georgia Station:			
Bul. 83, Oct., 1908 .....	635		
Hawaiian Sugar Planters' Station:			
Div. Agr. and Chem. Bul. 27, 1908 .....	613		
Indiana Station:			
Bul. 127, Sept., 1908 .....	673		
Iowa Station:			
Bul. 100, July, 1908 .....	687		
Bul. 101, Oct., 1908 .....	676		
Louisiana Stations:			
Bul. 111, Sept., 1908 .....	633		
Bul. 112, Oct., 1908 .....	642		
Bul. 113, Sept., 1908 .....	625		
Massachusetts Station:			
Bul. 125, Oct. 1, 1908 .....	643		
Montana Station:			
Bul. 73, Sept., 1908 .....	667		
Nevada Station:			
Bul. 63 (An. Rpt., 1907) Dec., 1907 .....	631, 634, 649, 667, 678, 693		
Bul. 64, Sept., 1907 .....	664		
Bul. 65, Feb., 1908 .....	655		
New Jersey Stations:

Circ. 18 .....	636
Doc. 403 .....	630
Bureau of Statistics:	
Bul. 70 (10 cents) .....	690
Bul. 71 (10 cents) .....	690
Crop Reporter, vol. 11, No. 1, Jan., 1909 .....	690
Weather Bureau:	
Bul. R (\$1.75) .....	614
Monthly Weather Review, vol. 35, No. 13 (20 cents) .....	614
Office of Experiment Stations:	
An. Rpt., 1907 (60 cents) .....	661, 686, 691, 693

NOTE.—The publications of the United States Department of Agriculture, except those of the Weather Bureau, may be purchased from the Superintendent of Documents, Washington, D. C. For the publications of the Weather Bureau requests and remittances should be directed to the Chief of the Bureau. The price of *Experiment Station Record* is \$1.50 per volume, or 15 cents per number. The prices of other technical publications are given above. The publications of the State experiment stations are distributed from the stations and not from the Department.

# EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, PH. D., *Assistant Director*.  
Assistant Editor: H. L. KNIGHT.

## EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. BEAL.  
Agricultural Botany and Vegetable Pathology—W. H. EVANS, Ph. D.  
Field Crops—J. I. SCHULTE.  
Horticulture and Forestry—E. J. GLASSON.  
Foods and Human Nutrition—C. F. LANGWORTHY, Ph. D.  
Zootechny, Dairying, and Agrotechny—E. W. MORSE.  
Agricultural Chemistry—W. H. BEAL, C. F. LANGWORTHY, and E. W. MORSE.  
Economic Zoology, Entomology, and Veterinary Medicine—W. A. HOOKER.  
Rural Engineering—G. A. GRIFFIN.  
Rural Economics—J. B. MORMAN.  
Agricultural Education—D. J. CROSBY.

## CONTENTS OF VOL. XX, NO. 8.

	Page.
Editorial notes:	701
Abstract numbers of the Record	702
Recent work in agricultural science	798
Notes	

## SUBJECT LIST OF ABSTRACTS.

### AGRICULTURAL CHEMISTRY.

Estimation of iron, alumina, and phosphoric acid together, Cooksey	702
Analysis of phosphates and other salts, Caron and Raquet	702
The determination of phosphoric acid by the Pemberton method, Lagers	703
Determination of phosphoric acid as ammonium phosphomolybdate, Raben	703
Determination of water-soluble phosphoric acid, Pouget and Chouchak	703
Titration of phosphoric acid in the presence of chlorids, Boulez	703
A simple method of determining caustic lime, Pöpel	703
On the determination of caustic lime, Nowicki	703
Methods of water analysis, Brewster	703
The determination of oxygen consumed in waters, Chamot	704
New method of analysis	704
Further notes on humus acids, Van Schermbeek	704
The isolation of dihydroxystearic acid from soils, Schreiner and Shorey	704
Organic chemistry for advanced students, Cohen	704
Physiological chemistry, Halliburton	704
Hydrolysis of vicilin from the pea, Osborne and Heyl	704
Hydrolysis of legumelin from the pea, Osborne and Heyl	705
Influence of temperature on casein in alkaline solutions, Robertson	705
The equivalent of casein and its estimation, Matthaiopoulos	705
Medico-legal studies of starch by means of polarized light, Herman	705
Determination of pepsin with report of a new method, Fuld and Levison	706
The estimation of fat in dry milks, McLellan	706
The estimation of fat in dry milks, Droop Richmond	706
A new method for milk testing, Doherty	706
Detection of watered milk by the refractometer, Mai and Rothenfusser	706

	Page.
Simple colorimetric method for determination of formalin in milk, Jones	706
Limits of experimental error in estimating moisture in butter, Schoonjans	706
The detection of benzoic acid in butter, Halphen	707
The unsaponifiable constituents of cocoanut fat, Matthes and Ackerman	707
Microscopic examination of powdered cocoa and chocolate, Collin	707
Detection of vegetable albumin in sausage, Behre	707
The detection of plant protein in sausage, Schmid	707
The estimation of saltpeter in sausage meat and ham, Kreis	707
Normal occurrence of citric acid in wines, Dupont	707
The natural citric acid content of wines, Dupont	707
Citric acid in natural wines, Astruc	707
Citric acid in natural wines, Deniges	707
New method for determining fixed and volatile acid in wine, Pozzi-Escot	707
The indirect determination of the acidity of wine, Favrel	707
The determination of succinic acid in wine and liquors, Pozzi-Escot	707
Physicochemical analysis of wine, Dutoit and Duboux	708
The estimation of volatile bases in wine, Dutoit and Duboux	708
Notes on essential oils, Watts and Tempamy	708
Oil of orange, Dowzard	708
Per cent tables for oil in cotton-seed products, Herty	708
Carotene and substances which accompany it, Euler and Nordenson	708
Note on analysis of cutch and preparation of pure catechin, Singh	708
The technique of the chemical examination of human feces, Ôefele	709
Quantitative determination of creatin in urine by picric acid, Barberic	709
Analyses of wines	709
Report of the analyst [for the year ending November 30, 1907], Lythgoe	709
Report of agricultural chemical control station, Saxony, 1907, Müller	709
Miscellaneous analyses, Brunnich	709
[Miscellaneous analyses], 1907, Rördam	709
[Miscellaneous analyses], Juritz	709

## METEOROLOGY—WATER.

Meteorological observations by farmers, Grohmann	709
Sunspots and weather predictions	709
Accumulation and consumption of soil moisture in river plains, Oppokov	709
Climatic and soil moisture conditions in the Great Plains area, Briggs	711
Climate of the city of Buenos Aires	711
The climate of Abbassia, near Cairo, Keeling	711
The weather of Saxony during 1907	711
Damage caused by hail in Servia	711
Amount and composition of drainage waters during 1906-7, Hayman	711
Variations in the substances in natural waters, Weigelt and Mehring	711
Some features of Iowa ground waters, Hendrixson	712
Sterilizing water by permanganate of potash, Ferraud and Lambert	712
The Merthyr sewage farms, Harvey	712

## SOILS—FERTILIZERS.

Studies on soils, Atterberg	712
The annual fluctuations of soil temperature in different climates, Kühl	712
Comparative temperature of soils, water, and air, Schulze and Mehring	713
Behavior of organic matter of soils and osmotic pressure, König et al.	713
The water problem in agriculture, Russell	714
The loss of water from soil, von Seelhorst	714
Studies of soil moisture in the Great Plains region, Alway	714
Soils of the Great Plains: Nitrogen and humus, Alway and Trumbull	715
A soil survey of seventeen counties of southern Indiana, Shannon et al.	715
Agricultural soils [of Maryland], Clark and Mathews	715
Canada's fertile northland, edited by Chambers	715
Phosphoric acid in buntersandstein and the Black Forest, Bräuhäuser	716
Soils, Ingle	716
Analyses of soils, Juritz	716
On eruptive soils, Mohr	716
Soils of nonsugar districts	716

	Page.
The nitrogen compounds of the fundamental rocks, Hall and Miller.....	716
On the question of nitrification in the sea, Issatschenko.....	716
Quantity of nitric nitrogen in soils variously cultivated, Montanari.....	716
Mustard in relation to nitrogen assimilation, Lemmermann and Blanck.....	717
Chemical laboratory of the Ploti Station, 1907, Welbel and Winkler.....	717
Action of carbon bisulphid and other substances on soils, Störmer et al.....	718
Influence of oxygen on vegetable matter, Carbone and Marincola-Cattaneo.....	718
Notes on the rôle of micro-organisms in modern agriculture, Heinze.....	718
Nutrition of nitrogenous bacteria, Krzemieniewska.....	718
Inoculation experiments with Azotobacter; bacteriological studies in Madison soil; ammonification as affected by soil treatment, Lipman.....	718
Légume bacteria, Edwards and Barlow.....	719
Beneficial bacteria for leguminous crops, Earp-Thomas.....	719
The resistant power of root bacteria of leguminous plants, Simon.....	719
Increasing the yield by inoculation with Nitragin, Westmann and Hiltner.....	719
The new agriculture, Bottomley.....	719
The productiveness of the soil, Grégoire.....	719
The planting and reclamation of moors and bogs in Belgium, Grenfell.....	720
Progress in moor culture during the last 25 years, Fleischer et al.....	720
New methods in the field of moor culture, Tacke.....	720
Modern and early work upon the question of root excretions, Reed.....	720
Crop rotation and soil exhaustion, Fletcher.....	720
Annual review of agronomy, Zolla.....	721
The decomposition of manure, Sjollem and De Ruijter de Wildt.....	721
Absorption of atmospheric moisture by nitrogenous manures, Brownlee.....	722
Impurity of nitrate of soda and the use of crude nitrate, De Grazia.....	722
Comparative tests of sulphate of ammonia and nitrate of soda, Bachmann.....	722
Comparison of organic nitrogenous fertilizer with nitrate of soda, Popp.....	723
The use of nitrogenous fertilizers and of nitrate of lime, Malpeaux.....	723
Tests of the fertilizing value of synthetic calcium nitrate, Passerini.....	723
New sources of nitrogen, Gilchrist.....	723
Results of fertilizer experiments with nitrogen lime, Bachmann.....	723
Experiments with lime nitrogen as a fertilizer, Dusserré.....	724
Trials of calcium cyanamid in comparison with other nitrogen fertilizers.....	724
Influence of soil humidity on action of calcium cyanamid, De Grazia.....	725
Nitrification of calcium cyanamid in various types of soil, De Grazia.....	725
Absorption of calcium cyanamid in soil, Kappen.....	725
Experiments with calcium cyanamid and leucite, Bandini.....	725
Causes that determine liberation of potash in leucite in soil, Bernardini.....	726
What are the laws controlling potash assimilation? Wimmer et al.....	726
Comparative value of ordinary superphosphate, dried and calcined phos- phate and metaphosphate of lime, De Molinari and Ligot.....	726
Value of phosphoric acid in superphosphates and slag, De Caluwe.....	727
Factors which influence effect of difficultly soluble phosphates, Söderbaum.....	727
Increase or decrease of nitrogen in the soil by manuring, Gilchrist.....	728
Effect of lime on availability of soil constituents, Guthrie and Cohen.....	728
Influence of lime and magnesia on plants, Bernardini and Corso.....	728
Cooperative fertilizer trials in 1907, Forsberg and Weibull.....	728
Chemical manures in Italy, Towsey.....	729
The nitrogen question in Germany, Caro.....	729
Valuation and extent of the nitrate of soda deposits of Chile, Bertrand.....	729
The great nitrate fields of Chile.....	729
Composition of some Chilean caliches, Dafert.....	729
Nitrate facts and figures, 1908, James.....	729
Production of ammonium sulphate and gas from peat, Frank.....	729
The nitrification of peat, Wagner.....	729
The nitrification of peat.....	729
The nitrification of peat, Neuhauss.....	729
On the utilization of the nitrogen of distillation residues, Effront.....	730
The preparation and utilization of nitrogen compounds, Eyde et al.....	730
The fixation of atmospheric nitrogen as cyanamid.....	730
Formation of nitrogen oxid in high tension arcs, Haber and Koenig.....	730
Oxidation of nitrogen in high tension arcs under reduced pressure, Koenig.....	730
The manufacture of cyanamid in France, Pluvinage.....	730
On the formation of lime nitrogen, Jacoby.....	730
On the fixation of nitrogen by calcium carbid, Pollacci.....	730

	Page.
Lime nitrogen and its manufacture, Kempster	730
Present status of the electro-chemical manufacture of nitrate of lime	731
The origin of potash deposits, Erdmann	731
The utilization of potash in industry and agriculture, Krische	731
Use of crude potash salts in 1906 and 1902, Siemssen	731
The phosphate of Thomas slag, Kroll, jr	731
The phosphates of Florida	731
Phosphate in South seas, Dreher	731
Composition of the products of the eruption of Vesuvius in 1906, Paris	731
Australian fish fertilizer, Baker	731
Ash content of <i>Ecklonia crasperata</i> and percentage of iodine, White	732
Analyses of soils, guanos, and other fertilizing materials	732
Commercial fertilizers and chemicals, Hudson, Stallings, et al	732
The new Ohio [fertilizer] law	732

## AGRICULTURAL BOTANY.

Botanical features of North American deserts, MacDougal	732
Distribution of the roots of some annual cultivated plants, Rotmistrov	732
Specialization and alternation of host plants in the Uredineæ, Krieg	733
The present status of agricultural plant breeding, Fruwirth	733
Notes on bud mutations of <i>Solanum magtia</i> , Heckel	733
Influence of wound stimuli on adventitious buds, Van Beusekom	733
Some notes on grafting varieties of beans, Daniel	733
A method for the quantitative determination of transpiration, Freeman	733
A new respiration calorimeter, Pierce	734
On endospermic respiration in certain seeds, Stoward	734
Vitality and self-digestion of endosperm of some Gramineæ, Bruschi	734
Influence of sugar solutions on respiration, Maige and Nicolas	734
A physiological study of the development of fruits and seeds, Lubimenko	735
A chemical study of the ripening of tomatoes, Albahary	735
The physiological rôle of fat in plants, Dubaquié	735
The effect of electricity upon plants, Priestley	735
Temperature and growth, Balls	736
The influence of temperature on the action of poisons, Zehl	737
Studies on germination and plant growth, Pickering	737
The toxic property of bog water and bog soil, Dachnowski	738
On plasmolysis, Osterhout	738
Concentration of green coloring matter in plants, Lubimenko	738
Does the chemical substance called chlorophyll exist? Tsvett	739
Influence of nutrition, water, and illumination on plants, Bünger	739

## FIELD CROPS.

Seed culture and plant breeding in Württemberg, Fruwirth	739
Report of the government agrostologist and bontanist, Burt-Davy et al	739
Dry farming in Wyoming, Cooke	739
Rules for uniform seeding of grains for comparative investigations	739
Cereal and leguminous crops, Cavalcante	740
Report on tests with varieties of oats and barley at Garforth, 1907, Seton	740
Water requirement of beets, rye, and barley, von Seelhorst	740
Water requirement of lupines, potatoes, barley, and rye, von Seelhorst	740
Water content of grain furnished German army from crop of 1906	740
The culture of serradella and lupines on heavy soils, Heinze	740
Classification of brewing barleys from a technical standpoint	741
Physical characters of barley, Brown	741
The distinguishing characters of two-rowed barley varieties, Broili	741
Smooth-awned barleys, Regel	741
Enzymes in stored barley	741
[Analyses of barley]	742
Breeding agricultural plants, Fruwirth	742
Securing a stand of clover on the southern Iowa loess, Watson	742
Mendelian studies of Egyptian cotton, Balls	743
Cotton, De Sá	743
Cotton growing and Nigeria, Birtwistle	743
The effect of lime nitrogen on flax, Hoffmeister	743

	Page.
[Oats on different types of soil], Sjollesma and De Ruijter de Wildt	743
Beseler oats I, II, III, Dommes	744
Analysis of colonial oats, Lewis	745
The peanut, Adam	745
Rice culture in Asiatic Russia, Walta	745
A report on experiments with potatoes, 1907, Stewart	745
<i>Solanum commersonii</i> and <i>S. commersonii</i> violet, Bohutinský-Křiževčí	745
The culture of <i>Solanum commersonii</i> violet, A. and P. Andouard	745
Action of manganese on the potato and beet, Hendrick and Carpioux	745
Plant food consumption of beet during the first year, Andrlík and Urban	746
Fertilizer experiments with seed beets	746
Abnormally large beets, Andrlík and Urban	747
Sugar-beet breeding station of Wohanka and Co., Prague, De Rekowski	747
Annual report of the bureau of sugar experiment stations, Maxwell	747
The stripping of sugar cane in Formosa, Murakami	747
Sugar cane, De Medeiros	748
Acclimatization experiments with sweet potatoes, Bernegan	748
Fertilizer experiments with tobacco, Wagner et al.	748
The nature of tobacco fermentation, Jensen	749
Tobacco, De Carvalho	749
Observations on the breeding of <i>Vicia faba</i> , Lang	749
Report on a test of varieties of wheat at Garforth, 1907, Seton	749
Correlations in the wheat stem of importance in breeding, Albrecht	750
The book of wheat, Dondlinger	750
A short wheat survey of Bengal, Mookerji	750
Plant food ingredients in some common weeds, Stutzer and Seidler	750
Testing seeds by means of electricity, Johnson	750

## HORTICULTURE.

Recent investigations on the grafting of herbaceous plants, Griffon	751
The culture of early vegetables: The rôle of glass sashes, Castet	751
Climate, soil, and fruit culture, Bechtle	751
On fruit culture in Finland, Heikel	751
Commercial apple culture in mountain regions, Hutt	751
Strawberry culture, Waugh	751
Influence of the color of soil on the fruitfulness of grapes, Ravaz	752
The reconstitution of limy soils, Sagourin	752
Recent investigations on the shallow culture of grapes, Ravaz	753
The fertilizer requirements of grapes, Chippaz	753
The origin of the red color in grapes, Laborde	753
The origin of red colored grapes, Malvezin	753
Transformation of coloring matter in grapes during ripening, Laborde	753
Tea on the Congo	753
[Investigations in selecting and breeding opium poppies], Hayman	753

## FORESTRY.

The hardy conifers of Central Europe, Schelle	754
Form and content of the fir, Schiffel	754
Notes on the growth of pine trees at Greendale, Adams	754
Seeds of <i>Lophira alata</i> from Sierra Leone	754
Timbers from Uganda	754
On hardness tests of wood, Janka	755
Tests of treated timbers	755
Report on the lumber industry in the Russian Far East, Hodgson	755
Ceara rubber from Portuguese East Africa	755
Germinating period of <i>Funtumia elastica</i> seeds and method of shipment	755
Rubber of <i>Forsteronia floribunda</i> from Jamaica	755
The science of Para rubber cultivation, Wright	755
International Rubber Exposition in London, September, 1908, Soskin	756
Reports of the superintendent of forests for 1904-1906, Fox	756
A statistical review of the forest administration of Baden for 1906	756
Handbook for the Prussian forester, Radtke	756
Fire protection on the ticket patrol system, Avasia	756

## DISEASES OF PLANTS.

	Page.
Diseases and injuries to cultivated plants in 1905.....	756
The potato black scab, Johnson.....	756
Soil sterilizing, Bordeaux, and poisons for tobacco seed beds, Horne.....	756
Rust on wheat, Hayman.....	756
Peach leaf curl, yellows, rosette, and little peach, Worsham and Reed.....	757
Experiments for the control of <i>Peronospora</i> , Schellenberg.....	757
The chestnut bark disease, Sterling.....	757
The mildew of oaks, Mangin.....	757
Epidemic of oak mildew, Neger.....	758
Notes on some new diseases of Coniferæ, Borthwick.....	758
Annual report of the literature on plant diseases, Hollrung et al.....	758

## ECONOMIC ZOOLOGY—ENTOMOLOGY.

The zoological record, Sharp.....	758
A study of the pocket gopher, Dare.....	758
Rats and their animal parasites, Shipley.....	758
The leprosy-like disease among rats on the Pacific coast, Wherry.....	758
Experiments on rat extermination, Saigol.....	759
The warblers of North America, Chapman.....	759
Our American flycatchers, Bowdish.....	759
The midsummer bird life of Illinois: A statistical study, Forbes.....	759
A native bird destroying the sparrow, Musson.....	759
The value of birds as insect destroyers, Parrott.....	759
Locusts birds, Gunning.....	759
<i>Bufo fowleri</i> in northern Georgia, Allard.....	759
Report of scientific work in the field of entomology during 1906, Seidlitz.....	760
The new ideas on the origin of species by mutation, Cuénot.....	760
Notes on the value of introduced parasites or beneficial insects, Froggatt.....	760
Report of the entomologist, Howard.....	760
Notes from Angola, Wellman.....	760
Report of the State nursery inspector, Stene.....	760
Report on suppression of gipsy and brown-tail moths, Stene.....	760
Notes on the work against the gipsy moth, Felt.....	760
Description of new devices for rearing insects, Burgess.....	760
Field tables of lepidoptera, Forbes.....	760
Notes on the early stages of some Pamphila, Laurent.....	761
Katra (hairy caterpillars) in Gujarat, Patel.....	761
On the Proctotrypid genus <i>Anteon</i> , Chitty.....	761
Upon the aphid-feeding species of <i>Aphelinus</i> , Howard.....	761
Notes on the Coccinellidæ, Casey.....	761
Coccidæ and other insects in Java and tropical western Africa, Newstead.....	761
Present knowledge of the Odonata of Central America, Calvert.....	761
An army worm in the Transvaal, Thomsen.....	761
The seventeen-year cicada on Staten Island in 1907, Davis.....	761
A new predaceous enemy of the cotton boll weevil, Newell and Treherne.....	761
The first and last essential step in combating the boll weevil, Hinds.....	761
Notes on Transvaal tobacco pests, Howard.....	762
Insect pests of the mangel-wurzel, Lefroy.....	762
The earth flea, a common pest of winter vegetables, Jack.....	762
Grain weevils.....	762
Diseases and enemies of horticultural plants, Krüger and Röhrig.....	762
Experiments with remedies for insect enemies of fruit trees, Truelle.....	762
Massachusetts fruit trees and their insect foes, Fernald.....	762
Gosford-Narara fruit fly and codling moth control experiment, Gurney.....	762
Paraffin remedy <i>v.</i> poisoned bait [for the fruit fly], Mally.....	763
Notes on a chalcid ( <i>Syntomaspis druparum</i> ) infesting apple seeds, Crosby.....	763
The Smyrna fig and its pollinating insect, Lounsbury.....	763
Report of the investigations of the olive fly in France in 1907, Chapelle.....	763
The fight against the olive fly, Chapelle.....	763
The pear-tree cephid, Passy.....	763
Isolation of orange groves and fumigation for the white fly, Morrill.....	763
The parasitism of an aphid that attacks citrus fruits, Pierantoni.....	763
Cacao beetles and the use and application of lime, Anstead.....	764

	Page.
<i>Termes gestroi</i> and other termites found on rubber estates, Pratt.....	764
The brown scale of the gooseberry and currant, Newstead.....	764
On an enchytraeid worm injurious to the seedlings of the larch, Hewitt....	764
A new cecidomyiid on oak, Russell and Hooker.....	764
Life history of <i>Syagrius intrudens</i> , a fern-eating weevil, Mangan.....	764
A new species of tick from the Transvaal, Neumann.....	764
The structure, development, and bionomics of the house fly, II, Hewitt....	764
Observations on fleas with special reference to <i>Pulex cheopis</i> .....	765
The part played by insects in the epidemiology of plague, Verjbitski.....	765
Insect transmission of bubonic plague: San Francisco, Mitzmain.....	765
Preservation of plague bacillus in bedbug, Jordansky and Kladnitsky.....	765
Report on the anatomy of the tsetse fly ( <i>Glossina palpalis</i> ), Minchin.....	765
Reproduction and variations in the development of <i>G. palpalis</i> , Roubaud....	765
<i>Glossina palpalis</i> in its relation to trypanosomes, Minchin et al.....	765
The ability of tsetse flies to convey <i>Trypanosoma gambiense</i> , Ross.....	766
Descriptions and records of bees, Cockerell.....	766
Winter ventilation of hives, Dadant.....	766
[A digest and discussion of papers on bee keeping].....	766
Report of the State inspector of apiaries, Darby.....	766
The Argentine ant, a possible pest of the apiary, Benton.....	766
The silk industry, Peñañel.....	767

## FOODS—HUMAN NUTRITION.

Bearing of the metabolism of Bengalis on problems of nutrition, McCay.....	767
Parsimony in nutrition, Crichton-Browne.....	769
Fads and feeding, Read.....	769
Retail prices of food, 1890 to 1907.....	769
Cost of living of working classes in industrial towns of Great Britain.....	769
Studies of the dinners served in Berlin restaurants, Kifskalt.....	769
Food in Asiatic Turkey.....	770
The feeding of school children.....	770
The feeding of the soldier.....	770
Diets in tuberculosis, Bardsman and Chapman.....	770
Notes on scurvy in South Africa, Macrae.....	770
How to cure spleens for food, Williams.....	770
The cooking of legumes.....	770
The book of fruit bottling, Bradley and Crooke.....	770
Recipes for the preserving of fruit, vegetables, and meat, Wagner.....	771
The household gas-cookery book, Edden and Moser.....	771
The up-to-date home. Labor and money saving appliances.....	771
Refrigeration on the homestead, Jackson and Lea.....	771
Canned meats, McGill.....	771
On the nature and causes of taint in miscured hams, Klein.....	771
Drawn v. undrawn poultry, Burke.....	771
The water content of sausage, Röhrig.....	771
Water content of sausage, Kreis.....	771
Nut sausage, Kappeller and Theopold.....	772
The origin, manufacture, and uses of extract of meat.....	772
Meat extract, Röhrig.....	772
The food value of the herring, Milroy.....	772
Added preservatives in fish goods, Kozyn.....	772
The penguin egg.....	772
Preserved egg goods, Röhrig.....	772
Preserved egg yolk, Benz.....	772
Experiments on bread fermentation, Vandevelde, Bosmans and Revijn.....	772
The use of sugar in bread making, Dupont.....	772
A new type of bread for peasants, Gibelli and Grüner.....	772
Potentialities of plantain meal.....	772
How to prevent checking in biscuits and crackers, Crocker.....	773
The molecular weight of dextrin of honey from Conifera, Barschall.....	773
The composition of pineapples, Bonewitz.....	773
Spoiled plum jam, Köpcke.....	773
Olive oil, McGill.....	773
New experiments on olive preservation, Frezzonitti.....	773
Treatment of olives which have undergone fermentation, Kossowicz.....	773

	Page.
Swedish berry and fruit wines, Hofman-Bang	773
Some notes on claret, Schidrowitz	773
Analyses of malt liquors	773
Pickles, McGill	773
Changes produced in mustard by proteus, Bertarelli and Marchelli	774
Adulteration in red pepper, Grandmont	774
Pepper adulterated with vetch seeds, Fleury	774
Influence of preservatives upon health and metabolism, Wiley	774
Nitrous acid as an antiseptic, Shepard	774
Benzoic acid, Lehmann	774
Influence of soaking on boric acid content of canned goods, Röhrig	774
Food analysis No. 16, Bailey and Jackson	774
Food analysis No. 18, Willard	775
Foodstuffs, Hooper	775
The new Kentucky foods and drugs act, Scovell	775
Dairy and food laws of the State of Washington	775
Legislation for the control of adulteration and falsification, Toubau	775
Progress in the chemistry of food and condiments in 1907, Kutteneuler	775
Food and nutrition laboratory manual, Bevier and Usher	775
On the assimilation of protein introduced parenterally, Cramer	775
On the assimilation of protein introduced enterally, Pringle and Cramer	776
Studies of the precipitin reaction and heated proteins, Schmidt	776
Assimilation of animal and vegetable fat by man, Gerlach	776
The uric acid excretion of normal man, Hanzlik and Hawk	776
Daily variation in work of kidneys on constant diet, Braeuner	776
Increased body temperature of men working in hot climates, Kurita	776
The minimum physiological energy requirement, Lefevre	776
Calorimetric measurement of minimum energy requirement, Lefevre	776

## ANIMAL PRODUCTION.

The improvement of the Alpine region as a stock-raising country	777
Hays of southern Italy, Scurti and De Plato	777
The available energy of red clover hay, Armsby and Fries	777
Preservation of frozen turnips as ensilage, Fingerling	777
The grape as a feed for animals	777
The use of grapevine prunings as forage, Portele, trans. by Ottavi	777
Concentrated feeding stuffs, Maurizio	777
Feeding stuffs, Annett, Darbishire, and Russell	777
[Analyses of stock feeds], Ingle	777
Residual products of oil factories as animal foods, Nardini	777
Starch in feedstuffs, Davis	777
Gluten feeds—artificially colored, Gudeman	778
Cyclopedia of American agriculture.—Animals, Bailey et al.	778
Heredity, Thomson	778
Inbreeding, Mendelism, and the elucidation of live-stock history, Wilson	778
Color of Shorthorn cattle	779
The cost of producing beef in winter, Mackenzie	779
Feeding experiments with mature oxen and sheep	779
Breeding sheep for mutton, McKeown	779
Sheep raising for the production of wool in western Africa, Henry	779
Goats	779
The value of potatoes for pig feeding, Kellner et al.	779
Pig feeding experiments with skim milk, Klein	780
Feeding experiments with pigs, Klein	780
The East Friesian horse, Gross	780
Public measures for advancing the poultry industry in Germany, Knispel	780
Elementary analysis and distribution of nitrogen in eggshells, Buchtala	781
Investigations in animal nutrition in the second half of 1907, Zielstorff	781

## DAIRY FARMING—DAIRYING—AGROTECHNY.

Feeding experiments with milch cows, von Zweigbergk	781
Report of Malmöhus County cow-testing association, 1907-S. Nanneson	781
Cow-testing associations in Norway, 1906-7, Funder	781
Milking appliances and milking machines, Rosam	782

	Page.
Milking machines, Böggild	782
Dairying in southern Brazil, Redaccao, Bernardino, and Granato	782
Dairying in Finland, Konradi	782
Experiment station and dairy institute at Kleinhof-Tapiau, Hittcher	782
The lecithin content of milk, Nerking and Haensel	782
[Bacteriological studies of milk], Savage	782
Studies of the so-called sterilized market milk, Knüsel	783
Milk and its relation to infectious diseases, Trask	783
Supervision of milk supply in towns and cities, Bettendorf and Stier	783
Chicago pasteurizing rules	783
Process and apparatus for keeping milk sound, Mollinger and Rompies	783
The judging of milk with the aid of the fermentation test, Löhnis	783
Investigations on the fatty acids of butter, Siegfeld	783
[The presence of acidity in cream starters], Monrad	784
On the influence of feed on milk and cheese, Jensen	784
Influence of feeding root crops on Swiss cheese, Benterud and Iversen	784
On Norwegian whey and goat cheeses and their analyses, Hals and Sunde	784
[Gorgonzola cheese], Cornalba	784
[The use of baritine in cheese rind], Cutting, jr	784
The preparation of rennet, Marisé	785
Researches on the chemistry of milk and dairying, Grimmer	785
Report on the progress of agrotechnic industries for 1904 and 1905, Bode	785
Report on investigations and progress in manufacture of sugar, Bock	785
The sugar industry, Grotewold	785
Metals in contact with wine, Bertoni	785

## VETERINARY MEDICINE.

Three disease of importance to the State sanitarian, Mohler	785
Report of the cattle bureau, Peters	786
Report of State veterinarian, Luckey	786
Veterinary notes, Cave	786
Report on the civil veterinary department, United Provinces, Maxwell	786
Report of the Punjab veterinary college for the year 1907-8, Renouf	786
Report of the civil veterinary department, Eastern Bengal and Assam, for the year 1907-8, Harris et al	787
Report of the principal veterinary surgeon, Gray	787
Report of the government veterinary bacteriologist, Theiler	787
Animal diseases, Tucker	787
Common communicable diseases in the Philippine Islands, Moberly	788
Influence of symbiosis on pathogenicity of micro-organisms, Musgrave	788
Protozoa and disease, Clarke	788
Prevalence of animal parasites of man in Philippine Islands, Garrison	789
The spirochetes and their relationship to other organisms, Ward	789
The life history of <i>Trypanosoma equiperdum</i> , Moore and Breinl	789
Culture of trypanosomes in the proboscis of tsetse flies, Roubaud	789
Observations on sleeping sickness and other trypanosome infections, Mott	789
Atoxyl and trypanosomiasis, Boyce and Breinl	789
Literary references—Trypanosomiasis and sleeping sickness	790
Literary references—Plague	790
The cause and prevention of the spread of plague in India, Liston	790
Report on experiments to discover whether the common domestic animals of India are affected by plague, Bannerman and Kápadia	790
Filtration experiments with virus of cattle plague, Ruediger	790
Recurrent fever and <i>Pediculus vestimenti</i> , Sergeant and Foley	790
Abdominal hernia, O'Connor	790
Chronic arsenical poisoning of herbivorous animals, Harkins and Swain	791
A list of plants poisonous to stock, Parkinson and Russell	791
The foot and mouth situation, Pearson	791
Johne's disease in cattle, Beebe	791
Experiments with English and South African redwater, Theiler	791
An investigation in County Wexford of a disease in young cattle, Norris	791
Measures against animal tuberculosis in Denmark, Bang	791
The blood of the horse, Sabrazès, Muratet, and Durtoux	792

## RURAL ENGINEERING.

	Page.
Highway engineering, Morrison	792
A new system of road making	792
Effect of traction engine and motor traffic on road foundations, Thomas	792
Denatured alcohol in France, Mason	792

## RURAL ECONOMICS.

[Papers on rural economy], Źeleński et al	793
Mother earth: A proposal for the reconstruction of country life, Fordham	793
The administration of the small holdings act	793
Small holdings in England, Impey	793
Small holdings in Southwest Lancashire, Peet	793
In behalf of small proprietors, Aguet	793
The sale of lands to peasants [in Russia]	793
The agrarian question in Bosnia, Raffalovich	793
Economic relations of twenty-two farms, Baden, Bornemann	794
The progressive farmer, Gill	794
Cooperation for small holders, Cheney	794
Report of Agricultural Organization Society, 1907, Yerburch and Harris	794
Development of agricultural cooperative societies	794
Associations for the purchase of agricultural machines, Bérillon	794
Agricultural credit in Belgium in 1906-7, Gilliéron-Duboux	794
Agricultural legislation [in Portugal], compiled by Ramalho	794

## AGRICULTURAL EDUCATION.

Instructions in agriculture and forestry	795
Seventh report of Department of Agriculture and Technical Instruction	795
[Agricultural and forestry instruction in Austria and Germany]	795
[Agricultural and forestry education in Austria]	796
[Agricultural and forestry instruction in Austria and other countries]	796
Agricultural instruction in Saxony	796
The domestic training of girls in Germany and Austria	797

## MISCELLANEOUS.

Report of experiment station at Marburg for 1907-8, Haselhoff	797
Investigations by experiment station, Groningen, 1895 to 1897, Sjollem	797
Agricultural report for the year 1906, Henry	797
Agricultural writers, 1200 to 1800, McDonald	797
Batten's agricultural directory	797
Index to the first twenty volumes of <i>Bulletin de l'Association des Chimistes de Sucrierie et de Distillerie</i> , Pellet	797
Index, Proceedings, and Transactions of Royal Society of Canada	797

# EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, PH. D., *Assistant Director*.  
Assistant Editor: H. L. KNIGHT.

## EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. BEAL.  
Agricultural Botany and Vegetable Pathology—W. H. EVANS, Ph. D.  
Field Crops—J. I. SCHULTE.  
Horticulture and Forestry—E. J. GLASSON.  
Foods and Human Nutrition—C. F. LANGWORTHY, Ph. D.  
Zootechny, Dairying, and Agrotechny—E. W. MORSE.  
Agricultural Chemistry—W. H. BEAL, C. F. LANGWORTHY, and E. W. MORSE.  
Economic Zoology, Entomology, and Veterinary Medicine—W. A. HOOKER.  
Rural Engineering—G. A. GRIFFIN.  
Rural Economics—J. B. MORMAN.  
Agricultural Education—D. J. CROSBY.

## CONTENTS OF VOL. XX, NO. 9.

	Page.
Editorial notes:	
The agricultural appropriation act, 1909-10.....	801
Recent work in agricultural science .....	806
Notes.....	894

## SUBJECT LIST OF ABSTRACTS.

### AGRICULTURAL CHEMISTRY.

New determination of the mechanical equivalent of heat, Crémieu and Rispail.....	806
Accumulation of the heat of the sun in various solutions, von Kalesinszky.....	806
The formation and decomposition of ammonia in a Siemens tube, Davies.....	806
Composition of ammonia and atomic weight of nitrogen, Guye and Pintza.....	806
The modifications of the Kjeldahl method for nitrogen, Hepburn.....	806
Modified Hüfner method for volumetric determination of nitrogen, von Cordier.....	806
Electrolytic determination of nitric acid, Shinn.....	807
The determination of phosphoric acid as phosphomolybdic acid, Christensen.....	807
Application of the gasometric method to the determination of urea, Ronchèse.....	807
A method for the determination of ammonia in barnyard manure, Kristensen.....	807
The volumetric-alkalimetric determination of alkaline earths, Foerster.....	807
Determination of the combined lime in humus, De Mondesir.....	807
On the determination of carbon dioxide in water, Guth.....	807
Hydrolysis of vigin of the cowpea, Osborne and Heyl.....	807
An improvement in technique in hydrolysis of protein, Hugouenq and Morel.....	808
Concerning the identification of sugars, Blanksma and Van Ekenstein.....	808
Identification of $\delta$ fructose in the presence of other sugars, Pieraerts.....	808
The rapid determination of sugar in serum, Pellet.....	808
The Feh reaction for invert sugar in honey, Drawe.....	808
Concerning the biological method for the examination of imported meat, Müller.....	808
Sulphured fruit, Lührig.....	809
An electrical resistance method for the moisture content of grain, Briggs.....	809
On fat determinations in feeding stuffs, Palmquist.....	809
Simple method for quantitative separation of casein from human milk, Engel.....	809
Estimation of the protein content of milk, Bonnema.....	809

	Page.
Estimation of sugar in cow's milk, Van Driel.....	809
The estimation of inorganic compounds in milk, Allemann.....	809
Characteristics of oils from certain expressed seeds, Kochs.....	809
Characteristics of Japanese tea oil, Tsujimoto.....	810
Color reactions of sesame oil with aromatic aldehydes and sugars, Fleig.....	810
Technical chemists' handbook, Lunge.....	810
Leather trades chemistry, Trotman.....	810

## METEOROLOGY—WATER.

Weather forecasts.....	810
The occurrence of the foehn without subsequent precipitation, Mayr.....	810
A hailstorm following the course of an electric transmission-line, Violle.....	810
The action of electric power lines on hailstorms, Violle.....	810
Bulletin of the Mount Weather Observatory.....	811
Monthly Weather Review.....	811
Meteorological observations at Massachusetts Station, Ostrander and Lindblad.....	811
Meteorological summary for 1907, Patton.....	812
The climate of Innsbruck, Fessler.....	812
The climate and meteorology of Australia, Hunt.....	812
Climate, Ward.....	812
Geology and water resources of a portion of south-central Oregon, Waring.....	812
Geology and water resources of the Great Falls region, Montana, Fisher.....	812
Preliminary report on the ground waters of San Joaquin Valley, Mendenhall.....	813
Ground waters and irrigation enterprises in southern California, Mendenhall.....	813
Water conservation and irrigation.....	813
The disinfection of drinking water with hydrogen peroxid, Reichel.....	813
The industrial uses of ozone, particularly for purification of water, Perkin.....	813
The relative bacteriological contents of can, plate, and natural ice, Sparks.....	813
Water supply and sewerage.....	813
Sewage-grown crops.....	814

## SOILS—FERTILIZERS.

The storage of winter precipitation in soils, Widtsoe.....	814
Quantity and composition of drainage water, Norton.....	814
Distribution of water in the soil in furrow irrigation, Loughridge.....	815
The physical condition of the soil in relation to agriculture, Hallissy.....	817
Investigations on the composition of the air of cultivated soils, Lau.....	817
The content of radio-active emanations in soil air, Gockel.....	817
The absorptive power of a cultivated soil, Rosen and Heller.....	817
The colloids of cultivated soils, Ehrenberg.....	818
Topographic mapping of bottom lands in Illinois, McCrary.....	818
Superficial and agricultural geology—Ireland, No. 2. Soils, Kinahan.....	818
Soil analyses, Amos and Russell.....	818
Deli soils, Vriens.....	818
The value of mineralogical-petrographic soil analysis, von Sigmond.....	818
The alkali soils of the great Hungarian Alföld, Treitz.....	818
Lime and phosphates in Rhodesian soils, Cameron.....	819
Investigations on the fertility of noncalcareous soils, Paturel.....	819
The status of soil fertility investigations.....	819
Chemical principles of soil classification, Hopkins.....	819
Chemical principles of soil fertility, Hopkins.....	819
Bacteria for enriching the soil and increasing crop production, Banerjee.....	819
Notes on inoculation with Nitragin and inoculated soil, Heinze.....	819
Inoculation of gram seed with the tubercle-forming bacteria, Hayman.....	819
Protection of the soil in Hungary, Gonnard.....	820
Terracing of farm lands, Ashe.....	820
Improvement and management of eastern Virginia lands, Stubbs.....	820
Study of phosphoric acid and lime requirements of soils, Liechti.....	820
Fertilizer experiments at the Biological Agricultural Institute, Lommel.....	820
Manuring experiment on flooded (rice) ground, Van der Stok.....	820
Note on action of nitric acid in neutralizing alkaline soil, Symmonds.....	821
Artesian waters.....	821
Artesian irrigation: An antidote for alkaline waters, Symmonds.....	821
The most economical sources of nitrogen for plant food, Clinton.....	821
Behavior of lime nitrogen and nitrogen lime in storage and in soils, Popp.....	821

	Page.
Experiments on the use of calcium cyanamid as a fertilizer, Stutzer.....	822
Influence of potash fertilizers on the relation of grain to straw, Clausen.....	822
Silicate of potash as a fertilizer, Wein.....	822
Wood ashes as a fertilizer, Ten Eyck.....	822
Experiments on methods of application of superphosphates, Malpeaux.....	822
The agricultural value of low-grade Thomas slag, De Molinari and Ligot.....	822
The solubility of steamed bone meal in 2 per cent citric acid, Turk.....	822
The price and value of raw phosphates and so-called agricultural phosphates..	822
The action of gypsum as a fertilizer, Soave.....	823
Manganese sulphate, De Molinari and Ligot.....	823
The action of zinc in pot experiments, Ehrenberg.....	823
On the mixing of commercial fertilizers, Schulze.....	823
The use of peat in the preparation of fertilizers, Rousset.....	823
Obtaining ammonia from atmospheric nitrogen by means of peat, Woltereck..	823
Nitrogenous fertilizers prepared from peat, Maizières.....	824
Nitrate from ammonia, Jurisch.....	824
On lime nitrogen, Bredig.....	824
Cyanamid or lime nitrogen.....	824
Chilean nitrate fields, Hanna.....	824
Nitrate of soda.....	824
Peruvian guano.....	824
Phosphate deposits of Christmas Island, Woodward and Simpson.....	824
Deposits of phosphates in the Midland district [of Western Australia].....	824
Natal mineral phosphates, Pardy.....	824
Acetylene plant residue, Pardy.....	825
Utilizing the dogfish, Fleming.....	825
Utilizing stock yard waste.....	825
The disposal of sewage sludge.....	825
Sewage sludge as a manure.....	825
Chemicals and allied products, Munroe.....	826
Italy's production of chemical manures, Menozzi.....	826
Fertilizers in Australia.....	826
Artificial fertilizers in China.....	826
Report on commercial fertilizers, 1908, Jenkins and Street.....	826
Inspection and analyses of cotton-seed meal on sale in Mississippi, Hand et al.	826
Analyses of commercial fertilizers, Frear.....	826
Fertilizers as sold, 1908, McGill et al.....	827
Manures, Annett, Darbshire and Russell.....	827
Ohio fertilizer law.....	

## AGRICULTURAL BOTANY.

Solereder's Anatomy, trans. by Boodle and Fritsch, revised by Scott.....	827
A text-book of general bacteriology, Jordan.....	827
A bibliography of mycological literature, Lindau and Sydow.....	827
International catalogue of scientific literature. M. Botany.....	827
The development of the Uredineæ and the origin of new forms, Fischer.....	828
Field, garden, and orchard crops of the Bombay Presidency, Gammie.....	828
Seeds and plants imported from January 1 to March 31, 1908. Inventory No. 11	828
The germination of grass seed and a study of aleurone grains, Guilliermond.....	828
Chemical processes accompanying germination of seeds, Scurti and Parrozzani	828
Dry matter and chlorophyll under different intensities of light, Lubimenko.....	829
The transpiration of evergreen plants, Puglisi.....	829
The respiratory pigments of plants, Palladin.....	830
The elimination of carbon dioxid from dead plants, Nabokich.....	830
Relation of sugar and starch content of guard cells to stomata, Røsing.....	830
A study of amolytic ferments in oats, Klempin.....	830
Relation between phosphorus and formation of amino acids in plants, Scurti	830
Proteid formation in ripening seed, Wassilieff.....	831
Some chemical changes in the maturity of fruit, Scurti and De Plato.....	831
On the occurrence of zinc in plants, Javillier.....	831
Oleuropéine, a new glucosid from the olive tree, Bourquelot and Vintile-co	831
The abnormal development of wound tissues, Wulff.....	831
Investigations on forest injury due to smoke and gas, Gerlach.....	831
The injurious effect on plants and soils of flue dust, Haselhoff.....	831
A registering photometer, Mitscherlich.....	

## FIELD CROPS.

	Page.
Report of the advisory committee on soil investigation, McKeene.....	832
Summary of results on the experimental field at Ploti in 1907, Winkler.....	832
Report on the Cawnpore agricultural station for 1907, Hayman.....	832
Cereal culture on the dry lands of central Tunis, Leloup.....	832
<i>Alopecurus agrestis</i> , Fruwirth.....	833
The basis for judging brewing barley, Jalowetz.....	833
Comparison of field beets grown from seeds from same seed boll, Briem.....	833
Corn culture.....	833
The improvement of cotton by seed selection, Watts and Tempany.....	833
Hop experiments, Amos.....	833
Report from the select committee on the hop industry.....	834
The German hop crop of 1908.....	834
Duty on hops.....	834
The ixtle and its relations, Endlich.....	834
The cultivation of ground nuts, Sampson.....	834
Water culture method for experimenting with potatoes, Skinner.....	834
Commercial potato growing, Craig.....	834
The cultivation of tobacco in Kentucky and Tennessee, Scherffius et al.....	834
Production of tobacco under shade in the Connecticut Valley, Stewart.....	834
Sumatra tobacco: Culture, curing, marketing, Mathieu.....	835
The yellow berry problem in Kansas hard winter wheats, Roberts and Freeman.....	835
[Irrigation experiments with wheat, 1907-8], Gordon.....	837
Varieties of wheat grown in the Central Provinces and Berar, Evans.....	837
The wheat of Tomsk, Siberia, Flaksberger.....	837

## HORTICULTURE.

The modern kitchen garden, Gressent.....	837
Cabbages and cauliflowers: How to grow them, Gregory.....	837
The citron crop, Cheney.....	837
Mushrooms propagated from spores, Cooke.....	837
Inheritance in tomato hybrids, Price and Drinkard, jr.....	838
Influence of direct light on composition of fruits, Rivière and Bailhache.....	838
California fruits and how to grow them, Wickson.....	838
Varieties of fruit for growing in North Carolina, Hutt and Shaw.....	839
Fruit culture in Crimea, Barsaq.....	839
Nova Scotia apple industry.....	839
Dessert cherries in pots, Hudson.....	839
Biology and phylogeny of the fig and classification of figs, Celi.....	839
Fig cultivation in southern India and viticulture in Penukonda, Subba Rao.....	839
On a process of forcing grapes, Bonnier.....	839
Commercial fertilizer experiments with grapevines, Zacharewicz.....	839
Annual report of the wine-making station of Haro for 1907, De Zúñiga.....	839
Storage investigations with citrus fruits and grapes, Stubenrauch.....	840
Decay of Florida oranges in transit and on the market, Tenny et al.....	840
Orange trees for Texas, Stringfellow.....	840
A B C of lime cultivation, Jones et al.....	841
Coffee in the State of São Paulo (Brazil), Lalière.....	841
The fermentation of cacao and of coffee, Loew.....	841
The future of cacao planting, Smith.....	841
Report of the inspector of cocoanut trees for 1907, Brown.....	841
All about cinnamon, A. M. and J. Ferguson.....	841
Course on care of trees, Allen.....	841
Buying nursery stock.....	841
The best climbers south and north, Berckmans.....	841
Violet culture at Hyers and in the Mediterranean region, Foussat.....	841
Manual of floriculture, De Vilmorin.....	841
Gardening in California, landscape and flower, McLaren.....	842
Scottish gardens, Maxwell.....	842
Some continental gardens and nurseries, Bean.....	842

## FORESTRY.

Report on forestry, Thurston.....	842
Report of the superintendent of forestry, Hosmer.....	842
Report of the forest nurseryman, Haughs.....	843
Schedule for forest description.....	843

	Page.
The basket willow, Hubbard.....	843
Observations on the culture of <i>Juglans nigra</i> and <i>Carya alba</i> , Schwappach.....	843
The silva of Colorado. II, The poplars, aspens and cottonwoods, Ramaley.....	843
Interesting trees recently observed in western Georgia, Harper.....	843
Forestry: Practical notes for New South Wales.—Conifers, Maiden.....	843
Contribution to the knowledge of some timbers of the Eritrea Colony, Senni..	844
An analysis of Canada's timber wealth, Fernow.....	844
Wood preservation by the open-tank process, Hartmann.....	844
Experiments in tapping Ceara rubber trees, Wilcox.....	844
Report on the cultivation of rubber, Waterhouse.....	844
The rubber industry in the territories of Manica and Sofala, Johnson.....	844
On the rubber extracted from the latex of <i>Euforbia candelabro</i> , Rebuffat.....	845
Packing Para rubber seed for export, Main.....	845

## DISEASES OF PLANTS.

Report on economic mycology, Salmon.....	845
Occurrence of diseases and insect injuries in 1907, Schander.....	845
Troubles of alfalfa in New York, Stewart, French, and Wilson.....	846
Alfalfa troubles, Hall.....	846
A new smut on <i>Bromus secalinus</i> Magnus.....	846
Dry rot of potato tubers, Pethybridge and Bowers.....	846
Potato rot, Evans.....	847
The fruit spot of apples, Brooks.....	847
The apple-tree canker or black-rot fungus in South Africa, Evans.....	848
Die back of peach shoots, Massee.....	848
The citrus fruit rot, Evans.....	848
The diseases of the tea plant, Maublanc.....	848
A root disease of Para rubber trees, Gallagher.....	849
The disease of fir trees caused by <i>Phoma abietina</i> , Mer.....	849
The leaf rust of spruce, Delforge.....	849
Yellow stripe in daffodils, Darlington.....	850
Parasitic rose canker, Güssow.....	850
A new lilac leaf disease in England, Güssow.....	850

## ECONOMIC ZOOLOGY—ENTOMOLOGY.

The decision of the Supreme Court on the sale of imported game, Palmer.....	851
First report on the economic features of turtles of Pennsylvania, Surface.....	851
Influence of temperatures in limiting the distribution of insects, Sanderson..	851
Observations on the social parasites and slavery of ants, Wasmann.....	852
A preliminary list of the lepidoptera of western Pennsylvania, Engel.....	852
A monographic catalogue of the Mymarid genus <i>Alaptus</i> of Haliday, Girault..	852
Locust plague in Panama, Weitzel.....	852
Notes on grasshopper swarms in New South Wales during 1907-8, Gurney.....	852
Locust destruction work in the Transvaal, Gunn.....	852
Treatment of cotton pests in the West Indies in 1907, Ballou.....	853
The boll-weevil problem, with special reference to reducing damage, Hunter..	853
The boll-weevil problem, with special reference to reducing damage, Hunter..	854
The red cotton bug ( <i>Dysdercus cingulatus</i> ), Lefroy.....	854
The cotton leaf roller ( <i>Sylepta derogata</i> ), Lefroy.....	854
The tobacco caterpillar ( <i>Prodenia littoralis</i> ), Lefroy.....	854
Melon aphid, Lounsbury.....	854
A few orchard plant lice, Gillette and Taylor.....	856
Orchard plant lice and their remedies, Gillette and Taylor.....	856
Control of leaf blister mite in apple orchards, Parrott.....	856
Sulphur sprays for blister mite, Hall.....	856
A note on the fumigation of citrus trees with hydrocyanic-acid gas, Thomsen..	856
The castor semi-loopier ( <i>Ophiura melicerte</i> ), Lefroy.....	856
<i>Pemphigus tessellatus</i> : Alternate host, migrants, and true sexes, Patch.....	857
Chrysomelid enemies of the osier and experiments with insecticides, Feytaud..	857
A brief account of the anatomy and classification of the Ixodoidea, Bonnet....	857
A list of the ticks of South Africa, with descriptions and keys, Howard.....	857
A new genus of the Siphonaptera, Fox.....	857
Some Irish experiments on warble flies, Carpenter.....	857
Some Irish experiments on mosquitoes, Levy.....	857
The extermination of the etiology of bee diseases to the treatment, White..	858
The relation of the etiology of bee diseases to the treatment, White..	858
South African bee keeping, Attridge.....	858

## FOODS—HUMAN NUTRITION.

	Page.
Digestibility of starch of different sorts as affected by cooking, Day.....	858
Yeast, Ward.....	859
Changes in stored flour, Bell.....	859
The character of old flours, Vuafart.....	859
Milling and baking test. Tests of flour sold in North Dakota, Ladd.....	859
Chemically treated flours, Ladd.....	860
Effect of bleached flour extracts on rabbits, Ladd and White.....	861
Experiments on the spoilage of tomato ketchup, Bitting.....	861
On the dietetic value of refrigerated foods, Rideal.....	862
Preservatives in food, Collingridge.....	862
Salicylic acid as a preservative, Christian.....	862
[Food inspection, etc.], Emery.....	862
[Food analyses], McCrae.....	862
Food analyses, Juritz.....	863
Food inspection decisions.....	863
Notices of judgment.....	863
Revised food and drug regulations of the Louisiana State Board of Health.....	863
Labels and rulings, Ladd.....	863
Model food law bill, Ladd.....	863
Proposed uniform food law for the States.....	863
Convention of Association of State and National Food and Dairy Departments.....	863
Meat inspection and legislation on this subject, Martel.....	863
Practical hygiene, Ravenhill.....	863
Investigations of foot racers and bicycle racers, Pfeiffer.....	863

## ANIMAL PRODUCTION.

The self-heating of hay, Miede.....	864
Analyses of [South American] food and forage plants, D'Utra.....	864
Australian pasture herbs, Turner.....	864
Commercial feeding stuffs, Halligan.....	864
Investigations of feeding stuffs, Immendorff.....	865
Inspection and regulation of feeding stuffs, Kinzel.....	865
St. John's bread, a competitor of molasses feed.....	865
The Roseworthy Agricultural College flock in 1907-8, Perkins.....	865
Steer feeding experiments 1907-8, Mairs and Tomhave.....	866
Rolled oats as a substitute for milk in calf feeding, Michel.....	866
A summary of reports on feeding experiments with diastasolin.....	867
Outlook for the beef industry in Canada, Grisdale.....	867
The wool industry and its improvement, Geldard.....	867
Causes of the heavy loss of lambs in 1908, Quick and Spencer.....	867
Goat breeding, Bödeker.....	867
Foods supplementary to corn in fattening pigs, Burnett.....	867
The effect of food on breaking strength of bones, Burnett.....	868
Comparative experiments with swine of different breeding.....	869
Pork production in Denmark.....	869
The horse: Its selection and purchase, Barton.....	869
[The small hunter].....	870
Notes on horse feeding, Fredholm.....	870
The use of African elephants for transport service.....	870
Poultry fattening.....	870
The marketing of poultry.....	870
Some ostrich food plants, Burt-Davy.....	870
The preservation of eggs in the Tropics, Vosseler.....	870
Improved egg preservation, Stephens.....	870
Insurance of live stock [in the different European countries].....	870

## DAIRY FARMING—DAIRYING—AGROTECHNY.

[Feeding experiments with cows], Michels.....	871
The Canadian record of performance for pure-bred dairy cattle.....	871
Improvement in dairy herds, Carroll.....	871
The dairy institute in Germany, Weigmann.....	871
Milking machines, Haecker and Little.....	871
[The milk bottle question].....	873

	Page.
A note on the bacterial contamination of milk, Nash.....	873
The bacterial flora of milk, Koestler.....	873
The bacterial flora of Cheddar cheese, Harding and Prucha.....	873
Stringiness in Emmenthal cheese, Hohl and Steinegger.....	875
Studies on fermented milk. I, Yoghourt and matzoon, Kuntze.....	875
Alcohol industry in Germany, Thackara.....	875
Micro-photographic atlas of industrially important fibers, Herzog.....	875
Paper-making materials and their conservation, Veitch.....	875

## VETERINARY MEDICINE.

Annual report on the distribution of animal plagues in the German Empire....	876
Veterinary department, 1907, Oliver.....	876
Tuberculosis in animals and its relation to public health, Robertson.....	877
Tuberculosis of retropharyngeal lymphatic glands, Jowett.....	877
The protection of cattle against tuberculosis, Heymans.....	877
Study of vaccination of bovines against tuberculosis, Calmette and Guerin....	877
Economics as a positive factor in the dissemination of tuberculosis, Dyson....	878
Control and prevention of bovine tuberculosis in individual herds, Moore.....	878
The struggle against tuberculosis in cattle in Denmark, Bang.....	878
Suppression of tuberculosis among cattle on the continent.....	878
Bang's bacillus and its biology, Nowak.....	878
A contribution to the study of red dysentery of cattle, Zublin.....	878
The nodular disease of bovines an esophagostomiasis, Marotel.....	879
Changes in blood of parasite-infested sheep on innutritious diet, Giltner.....	879
Does lime and sulphur injure wools more than other dips? Hollings.....	879
The caustic soda and sulphur dip.....	879
Bovine piroplasmosis observed on the Ivory Coast, Bouet.....	879
Value of agglutination reaction in diagnosis of glanders, Collins.....	879
Lamziekte on the Kaap Plateau, Spreull.....	880
Report on swamp fever, Ballah.....	880
Equine piroplasmosis in Sardegna, Baruchello and Pricolo.....	880
Equine piroplasmosis, Pricolo.....	880
Contributions to the study of <i>Filaria irritans</i> , Fayet and Moreau.....	880
A case of Sarcosporidia in the horse, Moussu and Coquot.....	880
A case of tuberculosis in a horse, Anderson.....	881
Tuberculosis affecting the dorsal vertebra of a mare, Brown.....	881
Control of hog cholera by serum immunization, Melvin.....	881
Inoculation against hog cholera, Connaway.....	881
Studies on hog cholera and preventive treatment, King.....	882
Bruschetтини's hog-cholera vaccine and swine-plague serum, Wilson.....	882
The dog in health, accident, and disease, Barton.....	882
Experimental studies of acute ankylostomiasis in dogs, Cuillé.....	883
Kala-azar; cultures; inoculation of dogs; etiology, Nicolle.....	883
Canine origin of Kala-azar, Nicolle and Comte.....	883
A disease of fowls simulating in some respects fowl cholera, Robertson.....	883
A case of spirillosis of fowls in Bulgaria, Gareitschnoff.....	883
Spirochetosis of Cypriote fowls, Williamson.....	883
Fowl spirochaetiasis in Tunis.....	883
Animal parasites and parasitic diseases, Kaupp.....	884
Endoglobular hematozoa, Lutz and Meyer.....	884
Coexistence of a <i>Leptomonas</i> ( <i>Herpetomonas</i> ) and a trypanosome in a non-puncturing muscid ( <i>Drosophila confusa</i> ), Chatton and Alilaire.....	884
Report on the disease caused by the <i>Strongylus</i> parasite, Miller.....	884
Concerning <i>Trypanosoma congolense</i> , Laveran.....	884
The transportation of live stock, Mayo.....	884
The Seabury cattle spraying machine, Lounsbury.....	884
Apparatus of service in experimental pathology, Gay.....	884
Some common disinfectants, Dorset.....	884
Filing system for bulletins, pamphlets, and clippings, Reynolds.....	884

## RURAL ENGINEERING.

Cost of pumping for rice irrigation in Louisiana and Arkansas, Gregory.....	885
Pumping for irrigation, Rabeté.....	886
Irrigation pumping, Chatterton.....	886
Irrigation in Victoria, McKinney.....	886
Experimental irrigation farm, Allen.....	886

	Page.
An Egyptian steam cultivator.....	886
New cotton picking machine.....	886
Destruction of concrete by alkali, Headden.....	886
The construction and filling of silos, Linklater.....	886
Greenhouse and conservatory construction and heating, Hasluck.....	887
Ventilation for dwellings, rural schools, and stables, King.....	887

## RURAL ECONOMICS.

Better agriculture and how to get it, Hamilton.....	887
The latent forces of country life.....	887
Farmers' demonstration work in its relation to rural improvement, Knapp.....	887
Cooperation true Americanism Hays.....	888
Agricultural organization, Smithells.....	888
Producers' associations and cooperative societies in France.....	888
A serious menace to agricultural associations, Hubert-Valleroux.....	888
The legality of the operations of agricultural associations, Worms.....	888
The agricultural associations.....	889
Concerning agricultural credit in Roumania, Gociu.....	889
The improvement of farm labor conditions in North Germany.....	889
What influence has piecework on agricultural labor? von der Heyde.....	889
Farm laborer's wages.....	889
Cost of producing crops in the Hawkesbury district.....	889
Turkish land tenure.....	889
Crop Reporter.....	890

## AGRICULTURAL EDUCATION.

The educational needs of country life, Bryan.....	890
The work of the agricultural school in the scheme of State education, Soule.....	890
Centralized schools in Ohio, Graham.....	890
Teaching agriculture in public schools, Spillman.....	890
Agricultural education with special reference to Ireland, Campbell.....	890
Agricultural education, Mukerji.....	890
The College of Hawaii: Its work and outlook, Gilmore.....	890
The State Agricultural Institute, Gembloux, Raquet.....	890
College course for florists, Page.....	890
A course in agriculture for the public schools of Michigan, French.....	891
Agriculture and school gardens, Kelleher.....	891
Suggestions for school gardens, Williams.....	891
Improvement of school grounds, Hutt.....	891
Home nature-study course, Comstock.....	891
Nature's craftsmen, McCook.....	891
[Exercises in nature study].....	891
Propagation of plants, Davis.....	891
Tillage and cultivation, McCall.....	891
A corn primer, Knight.....	891

## MISCELLANEOUS.

Twenty-first Annual Report of Illinois Station, 1908.....	892
Nineteenth Annual Report of Mississippi Station, 1906.....	892
Twentieth Annual Report of Mississippi Station, 1907.....	892
Twenty-first Annual Report of Mississippi Station, 1908.....	892
Twenty-seventh Annual Report of Ohio Station, 1908.....	892
Report of the Imperial Department of Agriculture for 1905-6 and 1906-7.....	892
Report of the experiment station of the University of Jena for 1907.....	892
Memorial of the fiftieth anniversary of the experiment station at Pommritz.....	892
Note on agriculture in Japan, Nicholson.....	892
Encyclopedia of agriculture, edited by Green and Young.....	893
The British yearbook of agriculture and agricultural who's who, 1908-9.....	893
American Agricultural handbook for 1909.....	893
The commercial products of India, Watt.....	893
Press bulletins.....	893
Experiment Station Work, XLIX.....	893

# LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

## *Stations in the United States.*

	Page.
Colorado Station:	
Bul. 132, Sept., 1908.....	886
Bul. 133, Sept., 1908.....	854, 856
Bul. 134, Sept., 1908.....	856
Connecticut State Station:	
Bien. Rpt. 1907-8, pt. 8.....	826
Illinois Station:	
Circ. 123, Nov., 1908.....	819
Circ. 124, Nov., 1908.....	819
Twenty-first An. Rpt. 1908....	892
Kansas Station:	
Bul. 156, Oct., 1908.....	835
Bul. 157, Nov., 1908.....	881
Louisiana Stations:	
Bul. 114, Sept., 1908.....	864
Massachusetts Station:	
Met. Buls. 239-240, Nov.-Dec., 1908.....	811
Mississippi Station:	
Bul. 114, Nov., 1908.....	826
Nineteenth An. Rpt. 1906....	892
Twentieth An. Rpt. 1907.....	892
Twenty-first An. Rpt. 1908....	892
Nebraska Station:	
Bul. 107, Dec. 1, 1908.....	867, 868
Bul. 108, Dec. 7, 1908.....	871
New Hampshire Station:	
Sci. Contrib. 1, 1908.....	851
Sci. Contrib. 2, 1908.....	846
New York State Station:	
Bul. 305, Nov., 1908.....	846
Bul. 306, Dec., 1908.....	856
Tech. Bul. 8, Dec., 1908.....	873
North Carolina Station:	
Bul. 199, June, 1908.....	866, 871
North Dakota Station:	
Bul. 82, Oct., 1908.....	859
Spec. Bul. 8, Oct., 1908.....	863
Spec. Bul. 9, Dec., 1908....	860, 861
Spec. Bul. 10, Dec., 1908....	863
Ohio Station:	
Bul. 196 (Twenty-seventh An. Rpt., 1908), July, 1908....	812, 892
Pennsylvania Station:	
Bul. 88, Nov., 1908.....	866
Utah Station:	
Bul. 104, Oct., 1908.....	814

## *Stations in the United States—Continued.*

	Page.
Virginia Station:	
Bul. 177, July, 1908.....	838
Bul. 178, Aug., 1908.....	867
Washington Station:	
Popular Bul. 10, Sept., 1908..	886
Popular Bul. 11, Oct., 1908....	834

## *U. S. Department of Agriculture.*

Circ. 27.....	882
Farmers' Bul. 341.....	843
Farmers' Bul. 342.....	893
Farmers' Bul. 343.....	834
Farmers' Bul. 344.....	853
Farmers' Bul. 345.....	884
Food Insp. Decisions 97-103.....	863
Notices of Judgment 28-37.....	863
Bureau of Biological Survey:	
Circ. 67.....	851
Bureau of Chemistry:	
Bul. 119 (10 cents).....	861
Circ. 41.....	875
Bureau of Entomology:	
Bul. 75, pt. 4 (5 cents).....	858
Bureau of Plant Industry:	
Bul. 137 (10 cents).....	828
Bul. 138 (15 cents).....	834
Circ. 19.....	840
Circ. 20.....	809
Circ. 21.....	887
Bureau of Statistics:	
Crop Reporter, vol. 11, No. 2, Feb., 1909.....	889, 890
Weather Bureau:	
Bul. Mount Weather Observ., vol. 1, pt. 4 (25 cents per part, \$1 per volume).....	811
Monthly Weather Review, vol. 36, Nos. 9-10, Sept.-Oct., 1908 (20 cents per number, \$2.50 per year).....	811
Office of Experiment Stations:	
Bul. 201 (10 cents).....	885
Bul. 202 (10 cents).....	858
Bul. 203 (10 cents).....	815

NOTE. The publications of the United States Department of Agriculture, except those of the Weather Bureau, may be purchased from the Superintendent of Documents, Washington, D. C. For the publications of the Weather Bureau requests and remittances should be directed to the Chief of the Bureau. The price of *Experiment Station Record* is \$1.50 per volume, or 15 cents per number. The prices of other technical publications are given above. The publications of the State experiment stations are distributed from the stations and not from the Department.

# EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, PH. D., *Assistant Director*.  
Assistant Editor: H. L. KNIGHT.

## EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. BEAL.  
Agricultural Botany and Vegetable Pathology—W. H. EVANS, Ph. D.  
Field Crops—J. I. SCHULTE.  
Horticulture and Forestry—E. J. GLASSON.  
Foods and Human Nutrition—C. F. LANGWORTHY, Ph. D.  
Zootechny, Dairying, and Agrotechny—E. W. MORSE.  
Agricultural Chemistry—W. H. BEAL, C. F. LANGWORTHY, and E. W. MORSE.  
Economic Zoology, Entomology, and Veterinary Medicine—W. A. HOOKER.  
Rural Engineering—G. A. GRIFFIN.  
Rural Economics—J. B. MORMAN.  
Agricultural Education—D. J. CROSBY.

## CONTENTS OF VOL. XX, NO. 10.

	Page.
Editorial notes:	
The extension of agricultural instruction in the schools.....	901
Increased facilities for training agricultural teachers.....	902
English attitude toward applied science and agricultural studies.....	905
Recent work in agricultural science.....	906
Notes.....	906

## SUBJECT LIST OF ABSTRACTS.

### AGRICULTURAL CHEMISTRY.

The rusting of iron, Tilden.....	906
Rusting of iron, Friend.....	906
Corrosion of iron, Burgess.....	906
The principles and results of plant chemistry, Euler.....	906
Concerning the value and synthesis of protein, Hofmeister.....	906
Milk proteins, Olson.....	907
Hydrolysis of hordein, Kleinschmitt.....	907
Distinguishing phosphoprotein from nucleoprotein, Plimmer and Scott.....	907
A modification of the character of gluten in presence of sulphurous acid, Dugast.....	907
The constitution of starch, Gatin-Gruzewska.....	907
Further studies on the forms of milk sugar, Hudson.....	907
On the sugar of colostrums, Sebelien and Sunde.....	908
Preparation of a standard solution of litmus and litmus media, Brown.....	908
The determination of nitrogen, Taurke.....	908
Report of the committee on the analysis of phosphate rock, Hagedorn et al.....	908
Volumetric determination of phosphoric acid in fertilizers, Williams.....	908
The determination of cotton-seed hulls in cotton-seed meal, Fraps.....	908
Detection and determination of nitric acid in water and sewage, Klut.....	909
The determination of calcium carbonate in soils and its importance, Votruba.....	909
New method for estimation of lactic acid in animal organs and fluids, Jerusalem.....	909
The quantitative estimation of creatinin in urine, Edlefsen.....	909
The determination of reducing sugars from the weight of cuprous oxid, Browae.....	909
The precipitation of reducing sugars with basic lead acetate, Bryan.....	909
The precipitation of reducing sugars with basic lead acetate, Bryan.....	909
Errors in the polarimetric determination of sucrose when lead salts are used.....	909

	Page.
Refractometer studies, Wiechmann.....	909
Determination of nonsaccharin organic material in cane molasses, Hazewinkel.....	909
The resorcin hydrochloric acid reaction and its value, Riechen and Fiehe.....	909
The estimation of salt in imported pickled meat, Gröning.....	909
Detection of white corn flour in wheat flour products, Carlinfant and Salvatori.....	909
An analysis of cloves, Hodgson.....	910
Judging black pepper, Graff.....	910
The sanitary composition of cow's milk, Donsett.....	910
The examination of milk for dirt and leucocytes, Revis.....	910
Determination of the Reichert-Meissl number with glycerin-potash, Siegfeld.....	910
The analysis of cacao butter, Halphen.....	910
The estimation of cocoanut oil in butter, Ross.....	910
A method for detecting synthetic color in butter, Cornelison.....	910
The Rabild tube.....	910
Some constituents of saffron and a method for valuation, Pfyl and Scheitz.....	910
Composition of white lead and paints, Fraps.....	911
Report of State chemist, Knight.....	911
Extracts from proceedings of Association of Official Agricultural Chemists, 1908.....	911

## METEOROLOGY—WATER.

Relation of weather conditions to growth and development of cotton, Marbury.....	911
Periodical variations in climate, Meyer.....	912
Study of the results of hail shooting, Godinot.....	912
Atmospheric humidity charts, Fröhlich.....	912
Report of the Chief of the Weather Bureau, 1906-7.....	912
Meteorological observations.....	913
Meteorological records for 1907.....	913
Some climatic features of the Territory of Hawaii, Stockman.....	913
Climatological data, Belfort de Mattos.....	913
Swedish meteorological observations, 1907, Hamberg.....	913
British rainfall, 1907, Mill.....	913
Composition of Barbados rainfall.....	913
The chemistry of the River Nile, Lucas.....	914
Potable water and sewage.....	914
On the rôle of bacteria in the biological methods of sewage purification, Mair.....	914

## SOILS—FERTILIZERS.

The mineral composition of soil particles, Failyer, Smith, and Wade.....	915
Contribution to the subject of kaolin formation, Hähnel.....	915
On the radioactivity of the soil, Bordas.....	915
Soils of the United States, Whitney.....	915
Soil investigations at Aarslev Experiment Station, Christensen.....	916
Data of analyses of some wet soils of lower Friuli, Caratti and Bonomi.....	916
Analyses of soils from the Eden district, Guthrie.....	916
The meaning and value of the chemical analysis of soils, Watt.....	916
The absorptive capacity of some Russian soils, Zholtzinski.....	916
Pulverization and exhaustion of the soil in black fallow culture, Kulzhinski.....	917
Productivity of the black fallow in the steppes, Sokal'ski.....	918
Brief report of the Poltava Experiment Field for 1907, Tret'yakov and Verbetski.....	918
Brief report of the Kherson Experiment Field for 1906, Yanovchik.....	918
Fertility of various horizons of the soil, Sazanov.....	918
Zeolites and similar compounds, their constitution and importance, Gans.....	918
Soil moisture, Lehmann.....	918
[Effect of soluble salts in the soil on the growth of sugar cane], Harrison.....	919
The isolation of harmful organic substances from soils, Schreiner and Shorey.....	919
The nitrogen problem, Perotti.....	919
Leguminous plants as fixers of the nitrogen of the air, Passon.....	919
[Inoculation for leguminous plants], Harding.....	920
Fixation of atmospheric nitrogen by pure cultures of <i>Azotobacter</i> , Beijerinck.....	920
The variation and nitrogen fixing power of <i>Bacillus asterosporus</i> , Bredemann.....	920
The mineral nutrients of plants, Vageler.....	920
Nature and use of commercial fertilizers, Fraps.....	920
The purchase and use of commercial fertilizers, Marès.....	920
Influence of the weather on the action of fertilizers, von Sycianko.....	920

	Page.
Influence of precipitation on efficiency of commercial fertilizers, Grohmann.....	920
Some results of the use of chemical fertilizers in Carnia, Bonomi.....	921
Investigations on the composition of Peruvian guano, Maschhaupt.....	921
Studies on the preparation of nitrate, Jörgensen.....	921
Experiments on the action of nitrate of soda, ammonium salts, lime nitrogen, nitrogen lime, and the Norwegian lime niter, Schneidewind et al.....	921
The comparative fertilizer value of calcium cyanamid, calcium nitrate, ammonium sulphate, and sodium nitrate, Nazari.....	922
Lime nitrogen, sulphate of ammonia, and nitrate of soda, Tancré.....	923
Contribution to the ammonia question, I, Ehrenberg.....	923
The injurious effects of crude ammonia in vineyards, Berget.....	923
Ammonium sulphate, Lloyd and Bonelli.....	923
The production of ammonium sulphate, Atwater.....	924
Utilization of atmospheric nitrogen in production of calcium cyanamid, Frank.....	924
The ammoniacal fermentation of cyanamid, Ulpiani.....	924
Experiments with calcium cyanamid, Bonomi.....	924
Lime nitrogen and its changes in the soil, De Kruijff.....	924
Is it economically expedient to use potash fertilizers? Bonomi.....	925
Raw rock phosphate.....	925
Statistics of the production of phosphates in 1908, Maizières.....	925
Withdrawal of western phosphate lands for protection of the industry.....	925
Florida phosphate deposits, Sellards.....	925
The phosphates of Tunis, Maizières.....	925
The manufacture of superphosphate, Grueber.....	925
A test of manganese as a fertilizer, Bonomi.....	925
The fertilizing value of ashes, Pont.....	926
On the use of bracken as litter, Russell.....	926
A novel fertilizer industry, Judson.....	926
Fertilizer inspection, Woods and Bartlett.....	926
Analyses and valuations of commercial fertilizers and bone, Cathcart et al.....	926
Inspection of fertilizers, Van Slyke.....	926
Analyses of fertilizers, fall, 1907, and spring, 1908, Kilgore et al.....	926
Complete report on commercial fertilizers for 1908, Stewart and Hite.....	926
Fertilizer control laws, Welch.....	926

## AGRICULTURAL BOTANY.

The heredity of acquired characters in plants, Henslow.....	927
A laboratory course in plant physiology, Ganong.....	927
An introduction to experimental plant morphology, Goebel.....	927
The absorption of rain and dew by the green parts of plants, Henslow.....	927
Root development, Booth.....	927
Some chemical processes in the germination of seed, Scurti and Parrozzani.....	927
The transformation of cyanogenetic glucosids during germination, Guignard.....	928
Notes on plants containing hydrocyanic acid, Couperot.....	928
On the action of some organic substances on plants, Ciamician and Ravenna.....	928
The effect of alkaloids on regeneration in the scarlet runner bean, Morgulis.....	929
Studies on solanin from sprouts and flowers of the potato, Colombano.....	929
The influence of aluminum salts on protoplasm, Fluri.....	929
Effects of the rays of radium on plants, Gager.....	930
Influencing the growth of plants by electricity, Breslauer and Schmidt.....	930
On wind injury to plants, Noll.....	930
The formation of red wood in conifers, White.....	930
The distribution and occurrence of races of mistletoe in Bavaria, von Tubeuf.....	930

## FIELD CROPS.

Agricultural experiments, Ward, Bayley, and Dunstan.....	931
Work with field crops, Hall.....	931
Report on field trials on the manuring of seeds hay, Blackshaw.....	932
Dates of seeding winter grains, Hutcheson.....	932
Report on a field trial with varieties of barley.....	932
The blue grass of southwest Virginia, Ellett.....	932
Selecting seed corn, Carrier.....	932
Cotton culture in Palembang, Gutteling.....	932
Supply and distribution of cotton for the year ending August 31, 1908, Roper.....	932

	Page.
Report on field trials on the manuring of mangels, Blackshaw .....	932
[Variety tests with oats], Moorhouse .....	933
Tests with <i>Panicum maximum</i> and <i>Paspalum dilatatum</i> in Dutch East India ..	933
Field trials with potatoes: English, Scotch, and Irish seed, Blackshaw .....	933
Report on field trials on the manuring of potatoes, Milburn .....	933
The "spineless" prickly pears, Griffiths .....	933
Tests of sorghums, Wheeler .....	933
Report on experiments on growing sugar beets, Milburn, Golding, and Paine ..	934
Sugar beets in 1908, Ellett .....	934
The composition and production of sugar beets .....	934
Potash consumption of the beet during its first season, Andrlík and Urban ..	934
Experiments with seedling and other canes, D'Albuquerque and Bovell .....	935
[Variety tests with sweet potatoes], Morris .....	935
Tobacco experiments, Jensen .....	935
The relation of nicotine to the quality of tobacco, Garner .....	936
Alaska wheat investigation, French and Jones .....	936
Seed studies .....	937
Adulteration of seeds of alfalfa, clover, orchard and blue grass, Galloway ..	937
Feeds, seeds, and weeds, Jenkins .....	937

## HORTICULTURE.

Horticultural investigations, Booth .....	937
Vegetable-fruit seed distribution for 1909, Halsted .....	938
Mushroom culture, Növik .....	938
Fertilizer and irrigation experiments with onions, Waschka .....	938
Mendelian characters in tomatoes, Hedrick and Booth .....	938
Mendel's law applied in tomato breeding, Craig .....	939
[The influence of fertilizers on the structure of the tomato], Morris .....	939
Report of the South Haven Substation for 1907, Taft and Wilken .....	939
Fifth biennial report of the Montana State Board of Horticulture .....	939
The small fruits: Information concerning their culture, Troop .....	940
Variety test of strawberries and cultural directions, Taylor .....	940
Some newer strawberries, Taylor .....	940
Culture <i>v.</i> nonculture with grapes, Vivier .....	940
The grapes of New York, Hedrick et al. ....	940
Notes on the time of blossoming of fruit trees, Hooper .....	941
The American apple orchard, Waugh .....	941
Planting apple orchards in Idaho, Shinn .....	941
Orchard survey of Jackson County, Lewis, Bennett, and Vincent .....	941
The practical culture of coffee trees, Fauchère .....	942
Some observations on modern coffee culture in Java, Schuurman .....	942
Holly, yew, and box, with chapters on other evergreens, Dallimore .....	942
The peony, Coit .....	942
Dahlias and their cultivation, Wroe .....	942
Mesembryanthemum and portulacas, Berger .....	942
The perfect garden, Wright .....	943
Garden book, Biggle .....	943

## FORESTRY.

Silviculture based on natural principles, Mayr .....	943
The fundamental principles of forest management, Henze .....	943
The range-officer system in German state forest administration, von Benthheim ..	943
The value of normal yield tables in forest management, Ostwald .....	944
Forest conditions in Delaware and the forest policy for the State, Sterrett .....	944
Report of the State forester of Wisconsin for 1907-8, Griffith .....	944
Forest trees of the Pacific slope, Sudworth .....	944
The afforestation of poor agricultural soils, Möller .....	944
The afforestation of the infertile lands of small estates, Beck .....	945
Moss cover and natural regeneration, Böhmerle .....	945
The plant biology of the Flemish dunes, De Bruyne .....	945
The future use of land in the United States, Zon .....	945
Forests and reservoirs in their relation to stream flow, Chittenden .....	945
Wholesale lumber prices, 1886-1908 .....	945

## DISEASES OF PLANTS.

	Page.
The development of plant pathology during the past ten years, Solla.....	945
Report on plant protection.....	946
Botanical investigations, Stewart.....	946
Diseases of field crops in Delaware in 1907, Jackson.....	946
Report of the acting botanist and plant pathologist, Evans.....	946
Report of vegetable pathologist, Tryon.....	947
Annual report of the government mycologist, 1907, Gallagher.....	947
The wood-destroying fungi, Schorstein.....	947
The destruction of fungi by grain-drying apparatus, Lang.....	947
A successful experiment in combating the smut of barley, Kühle.....	947
Potato diseases in San Joaquin County, California, Orton.....	948
Spraying potatoes against blight and the potato beetle, Sandsten and Milward..	948
Potato spraying experiments in 1907, Stewart, French, and Sirrine.....	948
Diseased potato seed.....	949
The Granville tobacco wilt, Smith.....	949
The black rot of grapes, Ravaz.....	949
The control of the gray rot of grapes, Istvanffi.....	949
The white rot of grapes, Istvanffi.....	950
<i>Lathræa squamaria</i> as a parasite of the grape, Faes.....	950
Apple scab or black spot, Salmon.....	950
Review of information relating to olive diseases, Cuboni.....	950
[Spraying peaches and plums], Morris.....	950
Peach rot.....	951
Studies in cacao disease, Hart.....	951
Inoculation experiments with <i>Peridermium strobil</i> from <i>Pinus monticola</i> , Neger..	951
The use of copper fungicides, von Tubeuf.....	951
Sulphur as a pest remedy, Juritz.....	951

## ECONOMIC ZOOLOGY—ENTOMOLOGY.

Index-catalogue of medical and veterinary zoology, Stiles and Hassall.....	952
The otter in Massachusetts, Gordon.....	952
Investigations of the department of entomology, Parrott.....	952
Report of the department of botany and entomology, Nicholson.....	952
Notes from Connecticut, Britton.....	953
The common red spider, Chittenden.....	953
The introduction of <i>Iridomyrmex humilis</i> into New Orleans, Foster.....	953
[Injurious beetles], Mayet.....	953
Notes on some <i>Cecropia</i> cocoons and parasites, Smith.....	953
The semitropical army worm, Chittenden and Russell.....	954
Notes on the lesser clover-leaf beetle, Houghton.....	954
Factors controlling parasitism with special reference to boll weevil, Pierce....	954
A flea beetle attacking hops in British Columbia, Quayle.....	954
The leafhoppers of the sugar beet and their relation to "curly-leaf," Ball.....	955
The sugar-cane borers of Behar, Mackenzie and Lefroy.....	955
The grape-leaf skeletonizer, Jones.....	955
Sawfly larvæ in apples, Webster.....	955
The peach-tree bark-beetle, Wilson.....	956
The orange thrips, Moulton.....	956
The citrus whitefly of Florida consists of two species, Berger.....	957
The catalpa midge, Gossard.....	957
The importation of <i>Tetrastichus xanthomelænx</i> , Howard.....	957
Notes on maple mites, Parrott.....	957
A mosquito which breeds in salt and fresh water, Banks.....	957
Mosquito comment, Ludlow.....	957
The house mosquito, a city, town, and village problem, Smith.....	958
Remedies for the San José scale, Taylor.....	958
Homemade soluble oils for use against the San José scale, Phillips.....	958
Cooperative [spraying] experiments, Taft.....	958
Spray calendar, Sanborn.....	958
Spraying calendar, Taft and Shaw.....	958
Homemade oil emulsion, Taylor.....	958
Analysis of Paris green and other insecticides, Van Slyke.....	959
The danger in the use of arsenicals as insecticides, Mostrezo.....	959
A brief survey of Hawaiian bee keeping, Phillips.....	959
The status of apiculture in the United States, Phillips.....	959

## FOODS—HUMAN NUTRITION.

	Page.
Thirteenth report on food products for 1908, Street et al.....	959
Influence of food preservatives on health. V, Formaldehyde, Wiley et al....	961
Results of the investigations showing the effect of formaldehyde upon health..	963
Methods of canning meats, with reference to disposal of defective cans, McBryde..	963
Report of commission on certain Federal meat inspection regulations.....	963
Quantity and distribution of phosphorus in certain foods, Heubner and Reeb..	963
The bacterial content of cooked fish, Bruns.....	964
Edible fishes of New South Wales, Stead.....	964
Edible seaweed, Annett, Darbshire, and Russell.....	964
The water content of bread, Mezger.....	964
The behavior of ester compounds in the aging of wine, Scurti and Corso.....	964
Judging alcohol-free wine, Krasser.....	964
Report on the general conditions of Ichang and neighborhood, Little.....	964
[Diet in a reformatory for inebriates].....	964
Proposed ration for the agricultural school of Chile.....	964
School luncheons. How and what to prepare for them, Schoff.....	965
The new housekeeping, Barnard.....	965
The importance of intestinal bacteria in nutrition, III, Schottelius.....	965
The absorption of proteins, Halliburton.....	965
The effect of adding meat to a vegetarian diet, Albertoni and Rossi.....	965
Concerning the effect of maize diet, Bezzola.....	965
The available alkali in the ash of milk in relation to infant nutrition, Kastle..	965
Nutrition processes during the growth of the child, Rubner.....	966
Theory of nutrition after completion of growth, Rubner.....	966
Problems of growth and length of life from the standpoint of energetics, Rubner..	967
The problem of duration of life and its relation to growth and nutrition, Rubner..	967

## ANIMAL PRODUCTION.

[Experiments in animal production], Jordan and Wheeler.....	967
The computation of rations for farm animals by use of energy values, Armsby....	968
Feeds and feeding, Henry, trans. by Draenert.....	968
Concentrated commercial feeding stuffs, Jones, Haworth, and Abbott.....	968
Value of fodder plants at different stages of maturity, König and Fürstenberg..	968
Tropical fodder plants, Zimmermann.....	969
"Top feed" in Murchison and Gascoyne districts.....	969
Defecation with a view to cattle feeding.....	969
Digestibility of kale, vetch hay, and silage, Withycombe and Bradley.....	969
Experiments on the digestibility of prickly pear by cattle, Hare.....	969
Steer feeding. II, Winter steer feeding, 1906-7, 1907-8, Skinner and Cochel..	969
Steer feeding. III, Short v. long feeding periods, Skinner and Cochel.....	971
Feeding experiments with cattle and sheep, 1904-1908, Gilchrist.....	972
Cattle breeds of Morocco, De Gironcourt.....	972
The advantages of cattle raising in Guipuzcoa.....	972
Caracul sheep and broom meadows, von Lepel.....	972
Lamb feeding.....	972
Market classes and grades of sheep, Coffey.....	972
Principles of modern swine breeding.....	973
The preservation of our native types of horses, Rommel.....	973
Progress in Wisconsin horse breeding, Alexander.....	973
French breeds and poultry culture in Russia, De Gontcharoff.....	973
The poultry work of the Bureau of Animal Industry, Slocum.....	973
Mrs. Basley's poultry book, Basley.....	973
Cost of rearing ducklings, E. and W. Brown.....	974
Miscellaneous information concerning the live-stock industry, Roberts.....	974
The development of the export trade in pure bred live stock, Rommel.....	974
Experiments on the absorption of fat in healthy dogs, Plant.....	974
Arsenic in the animal body, Bloemendal.....	975

## DAIRY FARMING—DAIRYING—AGROTECHNY.

Influence of nonproteid compounds upon milk production, Morgen et al.....	975
The absorption of drugs by milk in the mammary glands.....	975
Methods for determining bacterial content of milk, Heinemann and Glenn....	976
Bacteria in milk in relation to composition of media, Northrup and Farrand...	976
Bacteria in milk, Rogers.....	977

	Page.
Investigations on the bacterial content of dried milk, Kossowicz.....	977
Milk and its products as carriers of tuberculosis infection, Schroeder.....	977
Some important factors in the production of sanitary milk, Webster.....	977
The classification of milk, Melvin.....	977
The chemistry of milk and milk products in 1907, Siegfeld.....	977
On the characteristics of butter, Hoton.....	977
Composition of Dutch butter made in the creameries under State control.....	977
Milled butter.....	978
The care and testing of Camembert cheese, Thom.....	978
Methods of paying for milk at cheese factories, Van Slyke.....	978
Paying for milk at cheese factories, Hall.....	978
Creamery accounting, Vye.....	978
The cow-testing association in dairying, Maris.....	978
The dairy industry in the South, Rawl, Stuart, and Whitaker.....	978
[The dairy industry in foreign countries].....	978
Dairy cattle in far-away India, Yoder.....	979
The dairying industry, Thomson.....	979
Milk booklet, Ostertag and Henkel.....	979
Tests of three devices for purifying milk, Van der Zande.....	979
[Some appliances for use in dairy bacteriology], Rahn.....	979
[Experiments in dairying and agrotechny], Harding and Van Slyke.....	979
Process for transforming milk into a solid substance, Frye.....	980
Preservation of unfermented fruit juice.....	980
Sulphurous acid in wine making, Dupont.....	980
Refrigeration in enology, Haas.....	980
The preparation of wine in Algeria, Foussat.....	980

## VETERINARY MEDICINE.

Effect of certain diseases and conditions of cattle on the milk supply, Mohler.....	980
Foot-and-mouth disease, Salmon and Smith.....	981
Surra, Needham.....	981
The influence of heredity upon tuberculosis, Latham.....	981
The eradication of tuberculosis in cattle, Melvin.....	981
The tuberculin test: Its method of application, value, and reliability, Mohler.....	981
The tuberculin test of cattle for tuberculosis, Mohler.....	981
The use of tuberculin in controlling tuberculosis in herds, Marshall.....	981
The ophthalmo-reaction to tuberculin in cattle, Wölfel.....	982
The epizootic diarrhea of calves and meat poisoning, Fally.....	982
The dehorning of cattle, Hickman.....	982
Inoculation of sheep against blue tongue and results in practice, Theiler.....	982
Tuberculosis of hogs: Its cause and suppression, Mohler and Washburn.....	982
Embryonal adenocarcinoma of the kidney in swine, Day.....	982
The leucocytes of the horse in health and disease, Tabusso.....	983
Strangles and glanders, Gray.....	983
The colic of horses, Wall.....	983
Influenza in horses, Cameron.....	983
Dermal mycosis associated with sarcoptic mange in horses, Melvin and Mohler.....	983
Infectious anemia or swamp fever of horses, Mohler.....	984
Researches upon the piroplasmosis of horses in 1907, Belizer and Markinowski.....	984
The administrative control of anthrax, Eurich.....	984
The theory and practice of antirabic immunization, Harvey and McKendrick.....	984
Curative influence of extracts of leucocytes on infections in animals, Hiss, jr.....	984
Progress in study of pathogenic micro-organisms, von Baumgarten and Tangl.....	985
A preliminary account of the Acanthocephales of mammals, Porta.....	985
Trypanosomes of mosquitoes and relation to Hemoprotozoa of birds, Mezincesco.....	985
Further experimental treatment of trypanosomiasis, Plimmer and Bateman.....	985
Plain facts about the hookworm disease.....	985
Rocky Mountain spotted fever, Robinson.....	985
Development of Leishman-Donovan parasite in <i>Cimex rotundatus</i> , Patton.....	986
Tenotomy of the perforatus in sprains of tendons, Querruan.....	986
Plants poisonous to stock. The wallflower poison bush, Brünlich.....	986
Disinfection and commercial disinfectants, Ravenel and Smith.....	986
Antiformin, a disinfectant which dissolves bacteria, Uhlenhuth and Nylander.....	987
Cremating furnace, Marshall.....	

## RURAL ENGINEERING.

	Page.
Irrigation in Wyoming, Johnston.....	987
Report on drainage of agricultural lands in the Kankakee Valley, Elliott.....	987
Drainage of agricultural lands of Bolivar County, McEathron and McCrory.....	988
The reclamation of waste lands in the Netherlands.....	988
Reservoirs for irrigation, water power, and domestic supply, Schuyler.....	988
Farm methods of applying land plaster in Oregon and Washington, Hunter.....	988
Trials of potato and beet harvesters, 1907, Birk and Dall.....	988
Trials of self-binders and mowing machines at Constantinsborg, 1908, Dall.....	989
The repair of farm equipment, Beattie.....	989
Handbook of farm buildings, ponds, etc., Winder.....	989
The King system of ventilation, Ocock.....	989
The disposal problem in rural districts, Lake.....	989

## RURAL ECONOMICS.

Builders of an agricultural commonwealth, Poe.....	989
The State agricultural committee of the Farmers' Union, Stallings.....	989
Some associations of agricultural importance, Raeymaeckers.....	990
The cooperative principle in agriculture in Denmark, Brinkmann.....	990
Jubilee of the Imperial Union of German Agricultural Cooperative Societies.....	990
Farming on shares in the present system of rural economy, Serpieri.....	990
Agriculture and the tariff in England, Bühler.....	990
The agricultural holdings act, 1908.....	990
Interim report of proceedings under small holdings and allotments acts, Elliott.....	991
Holdings of farm laborers, Delius.....	991
Propositions regarding the improvement of the farm laborer, Stieger.....	991
Measures to be taken to offset the lack of farm help, Dyhrenfurth.....	991
The rights of employers when farm laborers break their contracts, Schumacher.....	991
[Mexican farm laborers in the United States], Clark.....	991
Agricultural imports of the Netherlands.....	991
Crop Reporter.....	992

## AGRICULTURAL EDUCATION.

Annual report Winnebago County schools, 1908, Kern.....	992
The farmers' school, Graham.....	992
The successful farmer's education, Owens.....	992
Higher education for the farmer's wife, Jones.....	992
One woman's work for farm women, Buell.....	993
Agriculture in rural schools, Dunton.....	993
The Home Gardening Association.....	993
School gardening and nature study in English rural schools in London, Sipe.....	993
Manual for high schools with special reference to science and agriculture, Main.....	993
Teachers' manual of agriculture, nature study, and domestic science.....	993
Public school agriculture, 1909.....	993
Course in nature study and agriculture for schools of California, Johnson.....	994
The study of the evergreens in the public schools, Weed.....	994
Syllabus of lecture on production and marketing of eggs and fowls, Dryden.....	994
Annual report of farmers' institutes, 1908, Butler.....	994
Organization lists of the agricultural colleges and experiment stations, Agnew.....	994

## MISCELLANEOUS.

Annual report of the director for the fiscal year ending June 30, 1908.....	994
Biennial Report of Iowa Station, 1902-3.....	994
Biennial Report of Iowa Station, 1904-5.....	994
Annual Report of Iowa Station, 1906.....	994
Twenty-first Annual Report of Michigan Station, 1908.....	995
Twenty-sixth Annual Report of New York State Station, 1907.....	995
Director's report for 1908, Jordan.....	995
Seventeenth Annual Report of Oklahoma Station, 1908.....	995
Twenty-fourth Annual Report of the Bureau of Animal Industry, 1907.....	995
Report of committee on station organization and policy, Wheeler et al.....	995
Index to Yearbooks of the Department of Agriculture, 1901-1905, Greathouse.....	995

# LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

## *Stations in the United States.*

	Page.
Connecticut State Station:	
Bul. 161, Jan., 1909.....	937
Bien. Rpt. 1907-8, pt. 9.....	959
Delaware Station:	
Bul. 82, Dec., 1908:.....	944
Bul. 83, Dec., 1908.....	946
Bul. 84 (An. Rpt. 1908), Jan. 1, 1909.....	994
Idaho Station:	
Bul. 64, July, 1908.....	941
Bul. 65, Nov., 1908.....	936
Illinois Station:	
Bul. 129, Nov., 1908.....	972
Indiana Station:	
Bul. 128, Sept., 1908.....	940
Bul. 129, Oct., 1908.....	969
Bul. 130, Nov., 1908.....	971

Circ. 81.....	988
Circ. 82.....	995
Farmers' Inst. Lecture 10 (5 cents).....	994
Division of Publications:	
Bul. 9 (20 cents).....	995

NOTE.—The publications of the United States Department of Agriculture, except those of the Weather Bureau, may be purchased from the Superintendent of Documents, Washington, D. C. For the publications of the Weather Bureau requests and remittances should be directed to the Chief of the Bureau. The price of *Experiment Station Record* is \$1.50 per volume, or 15 cents per number. The prices of other technical publications are given above. The publications of the State experiment stations are distributed from the stations and not from the Department.

# EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, PH. D., *Assistant Director*.  
Assistant Editor: H. L. KNIGHT.

## EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. BEAL.  
Agricultural Botany and Vegetable Pathology—W. H. EVANS, Ph. D.  
Field Crops—J. I. SCHULTE.  
Horticulture and Forestry—E. J. GLÄSSON.  
Foods and Human Nutrition—C. F. LANGWORTHY, Ph. D.  
Zootechny, Dairying, and Agrotechny—E. W. MORSE.  
Agricultural Chemistry—W. H. BEAL, C. F. LANGWORTHY, and E. W. MORSE.  
Economic Zoology, Entomology, and Veterinary Medicine—W. A. HOOKER.  
Rural Engineering—G. A. GRIFFIN.  
Rural Economics—J. B. MORMAN.  
Agricultural Education—D. J. CROSBY.

## CONTENTS OF VOL. XX, NO. II.

	Page.
Editorial notes:	
Breeding projects at the American stations.....	1001
Animal breeding as a subject of research.....	1002
Recent work in agricultural science.....	1006
Notes.....	1095

## SUBJECT LIST OF ABSTRACTS.

### AGRICULTURAL CHEMISTRY.

Agricultural chemistry, Morgen and Fingerling.....	1006
Chemical industry in relation to agriculture, Frank.....	1006
Behavior of aluminum in milk, wine, and salt solutions, Von Fillinger.....	1006
On the precipitation of magnesium as ammonium-magnesium phosphate, Raffa.....	1006
The theory of the titrimetric determination of phosphoric acid.....	1006
Determination of water-soluble phosphoric acid in superphosphates, Schucht.....	1006
The determination of nitrogen in calcium cyanamid, Girasoli.....	1007
Comparative determinations of hardness in water, Klut.....	1007
The determination of the clay content of soils, Fletcher.....	1007
Shaking as a means of preparing soils for mechanical analysis, Kashinski.....	1007
Methods of testing the efficiency of ventilation, Richards et al.....	1008
Protein hydrolysis. Employment of hydrofluoric acid, Hugouenq and Morel.....	1008
The hydrolysis of fish muscle, Osborne and Heyl.....	1008
Concerning the constitution of phytin, Neuberg.....	1008
Extending the use of the precipitin reaction, Fiehe.....	1008
Concerning the identification of starch, Bloemendal.....	1008
The polarimetric determination of starch, Lintner.....	1008
The alkalinity of meat ash and the ash of some casein preparations, Kickton.....	1009
The identification of horse meat by the biological method, Schüller.....	1009
Examination of sausage, Kreis.....	1009
Identification of honey and detection of cane sugar, Fiehe.....	1009
The detection of formic acid in honey, Merl.....	1009
Error in the estimation of caffeine, Lendrich and Murdfield.....	1009

	Page.
Theobromin content of coco and new method for estimating, Kreutz.....	1009
Judging alcohol-free wine, Krasser.....	1009
Use of Fiehe's reaction for artificial invert sugar in wine, Kickton.....	1009
With what exactness can analytical data of wine examinations be represented..	1009
Participation of reductase in the process of alcohol fermentation, Palladin.....	1009
Color reactions as tests for heated milk, Herholz.....	1009
Differentiation of enzymes in milk by hydrogen dioxid and its tests, Lawall.....	1010
On the biological differentiation of milk, Bauer.....	1010
On recent rapid methods for estimating the fat content of cream, Rusche.....	1010
The estimation of the fat content in cream, Grimmer.....	1010
Butter and its adulterations under the microscope, Morres.....	1010
On the estimation of sugar in bagasse, Pellet.....	1010
Explanation of occasional abnormally high purity of some cane juices, Pellet...	1010
Determination of sugar in molasses feeds and denatured sugar products, Vauflart..	1010
Application of gasometric method to exact determination of urea, Ronchèse....	1011
Wood products, distillates and extracts, Dumesny and Noyer, trans. by Grant..	1011
Leather industries laboratory book, Procter.....	1011
A new mercury azotometer, Garcia.....	1011
A simple apparatus for the estimation of catalase, Koestler.....	1011
An apparatus adapted to a number of analytical purposes, Pozzi-Escot.....	1011

## METEOROLOGY—WATER.

Wireless telegraphy in the service of modern meteorology, Polis.....	1011
Wireless telegraphy in the service of modern meteorology, Herrmann.....	1011
Monthly Weather Review.....	1012
Meteorological observations at Massachusetts Station, Ostrander and Lindblad..	1012
Meteorological report, 1907, Auld.....	1012
Weather at Rothamsted in 1908, Willis.....	1012
Danish meteorological conditions in 1907-8, Willaume-Jantzen.....	1012
Meteorology.....	1013
Handbook of climatology, Hann.....	1013
Variations in climate, Arctowski.....	1013
Public water supplies, Turneure and Russell.....	1013
Chemical and biological survey of the waters of Illinois, Bartow et al.....	1013
Bacteria in water, Koch.....	1014
Features of report of Royal Commission on Sewage Disposal, Lemmoin-Cannon..	1014
Purification and disposal of town and factory sewage, Reich.....	1014

## SOILS—FERTILIZERS.

The agricultural soils of Cape Colony, Juritz.....	1014
The humus deposits in the limestone Alps, Wilhelm Graf zu Leiningen.....	1014
Contribution to the study of the humus matter of peat, Roger and Vulquin...	1015
Recent results of investigations in soil bacteriology, Simon.....	1015
Legume bacteria, Edwards and Barlow.....	1015
Investigations on the process of denitrification, Cingolani.....	1015
The action of heat and antiseptics on soils, Pickering.....	1015
The rôle of oxidation in soil fertility, Schreiner and Reed.....	1016
Soil improvement work, Conner.....	1017
Soil fertility, Hunt.....	1017
Theories of manure and fertilizer action, Hall.....	1018
[Miscellaneous fertilizer notes].....	1018
Experiments with chemical fertilizers in 1908, Chuard and Dusserre.....	1018
Cooperative fertilizer experiments in Sweden, 1907, Bolin.....	1018
Results obtained with different forms of nitrogen, Clausen.....	1018
Recent investigations of the nitrogenous fertilizers, Schreiber.....	1019
On the loss of nitrogen in drainage waters, Graffiau.....	1019
Loss of nitrogen by leaching of nitrate of soda, Schreiber.....	1019
Further note on the loss of nitrogen in drainage waters, Graffiau.....	1019
The loss of nitrogen by seepage of nitrate of soda, Schreiber.....	1019
Action of sulphate of ammonia containing acid, Lemmermann and Einecke.....	1019
The agricultural use of calcium cyanamid, Müntz and Nottin.....	1019
On the decomposition of lime nitrogen in soils, Immendorff.....	1020
Physiological action of dicyandiamid, Loew.....	1020
The importance of nitrogen, Steinmetz.....	1020

	Page.
The nitrogen question and its solution, Caro.....	1021
Sulphate of ammonia in 1908, Maizières.....	1021
The synthesis of ammonia by means of peat, Woltereck.....	1021
The oxidation of the nitrogen of the air, Schönherr.....	1021
A future substitute for nitrate of soda, Birkeland and Frank.....	1021
Calcium cyanamid.....	1021
New Canadian industry, Webster.....	1021
Potash silicate, Krišche.....	1021
Potash silicate (ground phonolith) as a potash fertilizer, Wagner.....	1022
Soil fertility and phosphoric acid, Fraps.....	1022
Shall we use natural rock or acid phosphate for Illinois soils? Hopkins.....	1022
Phosphoric acid of varying solubility as a fertilizer for meadows, Svoboda.....	1022
Modern land-pebble phosphate-mining plants in Florida, Mendenhall.....	1022
Phosphate industry in Tennessee, Ruhm.....	1022
Agricultural lime, Jenkins and East.....	1022
Lime, Rowe.....	1022
Gypsum deposits, Rowe.....	1023
Lime and marl examinations in Jutland, 1908, Kristensen.....	1023
Magnesia, its function and use in agriculture, Rigaux.....	1023
Manurial value of sewage and sewage sludge.....	1023
Analyses of ashes discharged during eruption of Vesuvius in 1906, Girasoli.....	1023
Consumption of fertilizers.....	1023
Fertilizers in South Australia, Summers.....	1023

## AGRICULTURAL BOTANY.

A statistical criterion for species and genera among the bacteria, Winslow.....	1024
Studies on bacterial enzymes, Zikes.....	1024
The proteases of plants, VI, Vines.....	1024
Concerning fungus desamidase, Pringsheim.....	1024
Concerning hydrating ferments in various gums, Boucher.....	1025
Preliminary investigations on the oxidizing diastases of plant latex, Cayla.....	1025
The influence of agitation on the growth of some of the lower fungi, Sartory.....	1025
The influence of light on the growth of <i>Rhizopus nigricans</i> , Raybaud.....	1025
The effect of light on germination, Kinzel.....	1026
The chemistry of chlorophyll, Schryver.....	1026
Studies in chlorophylls, Marchlewski.....	1026
The photodynamic work of chlorophyll extracts, Hausmann.....	1026
Protein changes taking place in green plants kept in the dark, Butkewitsch.....	1027
Chemical changes due to the wounding of plants, Friedrich.....	1027
The action of sulphur dioxide on plants, Wieler.....	1027
A new group of plants containing hydrocyanic acid, Greshoff.....	1027
<i>Centaurea aspera</i> , a plant containing hydrocyanic acid, Gerber and Cotte.....	1027
Seeds and plants imported from April 1 to June 30, 1908.....	1027

## FIELD CROPS.

Dry farming investigations in Montana, Atkinson and Nelson.....	1028
Alfalfa for seed production in semiarid regions, Brand and Westgate.....	1028
Alfalfa yields, 1908, Stevens.....	1029
Comparative variety tests with fodder beets, Vañha and Kyas.....	1029
Tests with fodder beets and of Mauthner treatment of beet seed, Kyas et al.....	1029
The sugar-beet crop in the principal European countries from 1898-1908, Dureau.....	1029
The American sugar-beet growers' annual, edited by Roderus.....	1030
Score cards for dent corn.....	1030
Fertilizer tests with cotton, Stevens.....	1030
Recent experiments with oats, Williams.....	1031
Varieties of potatoes grown in the Central Provinces, Evans.....	1031
Culture and preparation of sisal, Marquès.....	1031
The soy bean: A comparison with the cowpea, Mooers.....	1032
Food consumption of beet and relation to sugar content, Andrlík and Urban.....	1032
Experiments with varieties of sugar cane, Watts et al.....	1032
Manurial experiments, Watts et al.....	1032
Shelter-tent experiment with Sumatra-type tobacco, Frear.....	1033
Principles and practical methods of curing tobacco, Garner.....	1033

	Page.
Foreign tobaccos, De Bussy.....	1033
The production of wheat in the British Empire, Humphries.....	1033
Wheat and other cereals, Zolla.....	1033
Wheat fields and markets of the world, Smith.....	1033
The grain production of the world in 1908.....	1033
Cereal culture, Schindler.....	1033
Principal crops of the world, Warburg and Van Someren Brand.....	1034

## HORTICULTURE.

Ninth report of Woburn Experimental Fruit Farm, Bedford and Pickering....	1034
Contribution to the study of the injection of nutrients into fruit trees, From.....	1035
A radical change in the method of determining fruit varieties, Janson.....	1035
The specific weight of fruit varieties, Zimmerman.....	1036
Papers read at the summer meeting of the Ohio State Horticultural Society....	1036
French gardening, or intensive cultivation on the French system, Newsome....	1036
Sugar corn and tomatoes, McHatton.....	1036
[The selection of tomatoes for a higher yield], Troop and Woodbury.....	1037
Raspberries, blackberries, and loganberries in Washington, Thornber.....	1037
Factors affecting keeping quality of grapes while in transit and in storage....	1037
The Rixford: A new type of Smyrna fig, Swingle.....	1037
The first season with the peach orchard, Blake.....	1037
Report of progress with citrus fruits, Waschka.....	1038
Cacao culture in West Africa, Chevalier.....	1038
Relationship and classification of the Italian varieties of the almond, Biasco....	1038
Herbaceous perennials tested in the arboretum and botanic garden, Macoun....	1038
Sweet peas and their cultivation for home and exhibition, Curtis.....	1039

## FORESTRY.

Report of Poyal Commission on coast erosion, reclamation, and afforestation..	1039
Investigations of forestry problems along the North Carolina banks, Pratt.....	1039
Second annual report on forest conditions in Ohio, Green.....	1040
Forest survey of Litchfield and New Haven counties, Hawes and Hawley.....	1040
Seventh report of the forest commissioner of the State of Maine, Ring.....	1040
Fifth annual report of the State forester of Massachusetts, Rane.....	1040
Annual report on state forest administration in South Australia for 1907-8, Gill..	1040
Report on forest statistics of Alsace-Lorraine.....	1041
The timber industry in north Germany, Marchet.....	1041
Researches on the woods of African leguminous trees, Perrot and Gérard.....	1041
A Philippine substitute for lignum-vitæ, Hutchinson.....	1041
Physiological principles involved in the tapping of rubber trees, Fitting.....	1041
On the plantation, cultivation, and curing of Para Indian rubber, Wickham....	1041

## DISEASES OF PLANTS.

Examples of the use of the microscope in investigating plant diseases, Appel..	1042
Two little-known Myxosporiums, Edgerton.....	1042
Investigations on diseases of cereals in 1908, Störmer.....	1042
Formalin for oat smut, Goss.....	1043
The rust of timothy, Kern.....	1043
The browning of the bracts of hops due to lime nitrogen, Wagner.....	1043
Varieties of potato scab.....	1043
Dry scab of potatoes, Massee.....	1043
Potato spraying experiments in 1908, Stewart, French, and Sirrine.....	1043
Potato spraying in dry seasons, Hall.....	1044
Scab, early blight, and mildew, Johnson.....	1044
[Spraying experiments with cantaloups], Troop and Woodbury.....	1044
Melon wilt, Troop and Woodbury.....	1044
The gooseberry mildew, Eriksson.....	1044
Exosmosis in the roots of plants and combating chlorosis, Truffaut.....	1044
Apple blotch, a serious disease of southern orchards, Scott and Rorer.....	1044
Scaly bark of citrus, Fawcett.....	1045
Fungus diseases of cacao and sanitation of cacao orchards, Stockdale.....	1045
Bud rot of the coconut, Copeland.....	1046
The blue rot of coniferous timber, Münch.....	1046
A fir disease in Saxony, Neger.....	1047

	Page.
The white-pine blight in Maine, Morse.....	1047
The infectious chlorosis of the Japanese euonymus, Baur.....	1047
The destruction of wood by fungi, Buller.....	1047
North American rose rusts, Arthur.....	1047

## ECONOMIC ZOOLOGY—ENTOMOLOGY.

Spring practice in economic zoology, Gossard.....	1048
Eighth report of the State entomologist, 1908, Britton.....	1048
Insect notes for 1908, Patch.....	1049
The apple leaf hopper and other injurious insects of 1907 and 1908, Washburn.....	1049
Reports of orchard inspectors.....	1050
A European ant ( <i>Myrmica levinodis</i> ) introduced into Massachusetts, Wheeler.....	1050
Notes on Tenthredinoidea, with descriptions of new species, I, Rohwer.....	1050
A list of parasites known to attack American Rhynchophora, Pierce.....	1050
Notes on the life history of <i>Nonagria oblonga</i> , Walton.....	1051
A bit of contemporary history, Slosson.....	1051
Biological studies on three species of Aphididæ, Davis.....	1051
Notes and descriptions of some orchard plant lice of the Aphididæ, Gillette.....	1051
The army worm at Durham, N. C., Metcalf.....	1051
Experiments for the control of the red spider in Florida, Russell.....	1051
Notes on the grass mite, <i>Pediculopsis graminum</i> , Hodgkiss.....	1051
Dimples in apples from oviposition of <i>Lygus pratensis</i> , Taylor.....	1051
<i>Crocigrapta normani</i> , Patch.....	1052
The tussock moth in orchards, Schoene.....	1052
Orchards injured by tussock moth, F. H. Hall.....	1052
Must the calyx cup be filled? Slingerland.....	1052
Proprietary and homemade miscible oils for the San José scale, Jarvis.....	1053
Miscellaneous treatment for San José scale, Symons.....	1053
Notes on <i>Aspidiotus destructor</i> and its chalcid parasite in Tahiti, Doane.....	1053
Care of scale-infested trees, Surface.....	1053
Whitefly studies in 1908, Berger.....	1054
The saddled prominent ( <i>Heterocampa guttivitta</i> ), Patch.....	1054
A new species of the Tortricidæ, Fernald.....	1054
Work of the Bureau of Entomology against forest insects, Hopkins.....	1054
Tick eradication, Cotton.....	1055
Another chalcidoid parasite of a tick, Howard.....	1055
Notes on fleas collected in San Francisco and elsewhere, Doane.....	1055
Notes on the hen flea ( <i>Xestopsylla gallinacea</i> ), Herrick.....	1055
The foul brood of bees and the foul-brood law, Herrick and Scholl.....	1055
Calendar for treatment of plant and insect pests, Green, Selby, and Gossard.....	1055
Treatment of plant diseases and insects in South Carolina, Barre and Conradi.....	1056
Washington State College spraying calendar for 1909, Beattie and Melander.....	1056
Cyanid as an insecticide, Woglum and Wood.....	1056
Preliminary report on results of analysis of Paris green, Fuller.....	1056
The economic entomologist in business, Frost.....	1056

## FOODS—HUMAN NUTRITION.

The chemical examination of poultry kept in cold storage, Boos.....	1056
The bacteriological examination of poultry kept in cold storage, Brown.....	1056
Cold storage and its relation to food preservation, Bureau.....	1057
The oyster question.....	1058
Concerning changes in egg pastes when stored, Popp.....	1058
Analysis of gases contained in swollen canned goods, Tonney and Gooken.....	1058
The manufacture of preserved meat goods, Dosquet.....	1059
"Vapor," a preparation for smoking meat, Juckenack.....	1059
A new preservative for fruit juice, Juckenack.....	1059
Contribution to the fruit-juice statistics of 1907-8, Juckenack.....	1059
Fruit statistics 1908, Lührig, Bohrisch, and Hepner.....	1059
Supplement to fruit juice statistics for 1908, Behre, Grasse, and Schmidt.....	1059
Note on fruit juice statistics, Hartel, Hase, and Mueller.....	1059
Note on fruit juice statistics, Gronover.....	1059
Composition of berries with reference to alkalinity of ash, Fischer and Alpers.....	1059
Examination and judging of lemon juice, Frisch.....	1059

	Page.
Composition of a number of natural wines from southern France, Fiehe .....	1059
Swiss wine statistics for the year 1907.....	1059
Food and drug inspection.....	1059
Report of the analyst, Lythgoe.....	1059
[State food and dairy commission report], Emery.....	1059
Chemist's analyses, Fischer.....	1060
[Report of the dairy, food, and oil commissioner of Wyoming], Burke.....	1060
Food-inspection decisions.....	1060
Notices of judgment.....	1060
Food legislation during the year ended June 30, 1908, Bigelow and Parkinson ..	1060
Ohio food and drug laws, Dunlap.....	1061
Regulations under the public-health act, 1907, Provis.....	1061
Food inspection at ports of entry, Dearden.....	1061
The importance of pure-food laws for fruit and vegetable products, Echtermeyer ..	1061
Essentials of diet in health and disease, Pope and Carpenter.....	1061
The baby, Brown.....	1061
Carrot soup for infants, Moro.....	1061
Dietary conditions in Java, Matignon and Salm .....	1061
[Food of Dundee mill operatives], Clark.....	1061
[The new army ration, fireless cookers, etc.].....	1061
The up-to-date home. Money and labor saving appliances, Le Bosquet .....	1062
Experiments with an ash-free diet, Goodall and Joslin.....	1062
Effect of certain food accessories on the activity of digestive juices, Togami.....	1062
A study of the enzymes of the human pancreatic and intestinal juice, Hoelscher ..	1062
Concerning "secretins," Von Fürth and Schwarz.....	1063
Respired air, Weichardt.....	1063
Muscular work and pulse rate, Aulo.....	1063
Concerning the body temperature of man, Rancken.....	1063
Animal heat, Tolkowsky.....	1063

## ANIMAL PRODUCTION.

The feeding value of cereals as calculated from chemical analyses, Chamberlain ..	1063
Modern views concerning the food requirements of farm animals, Hansson.....	1065
The mineral elements in animal nutrition, Forbes.....	1065
Commercial feeding stuffs, Jenkins and Street.....	1065
Commercial feeding stuffs in 1907-8, Carson and Fraps.....	1065
Concentrated commercial feeding stuffs, McGill.....	1065
Sugar-producing product (desiccated beet root), McMullen.....	1066
Steer feeding, Scott.....	1066
Raising calves on skim milk, Eckles.....	1066
The cost of raising young stock, Dettweiler.....	1066
The preparation of a herd book for cattle, König.....	1066
The sheep industry from the market standpoint, Coffey.....	1066
Sheep husbandry in Canada, Spencer.....	1066
The raising of sheep and goats for milk production, De Castro.....	1066
Annual wool review, McPherson.....	1067
On digestion of meat in the stomach and small intestine of swine, Lötsch.....	1067
Food requirements of growing and fattening swine, Dietrich.....	1068
The deposition of fat and lean in hogs, Dinwiddie and Short.....	1068
Pork production under North Dakota conditions, Richards.....	1068
Protein digestion in horses, Rosenfeld.....	1069
Diastasin as a nutrient for horses, Schade.....	1070
Egg records.....	1070
The egg trade of the United States, Hastings.....	1070
Infection and preservation of eggs, Lamson, jr.....	1070
Humane slaughtering. Improved foreign methods.....	1071
Recent theories and experiments on heredity and inheritance, Drinkwater.....	1071
The possibility of inheritance through the placental circulation, Lewis.....	1071
Recent researches on the determination and heredity of sex, Wilson.....	1071
A new color variety of the guinea pig, Castle.....	1072
Inheritance in canaries, Davenport.....	1072
Influence of the testes upon the secondary sexual characters of fowls, Walker... ..	1073

DAIRY FARMING DAIRYING AGROTECHNY.

Page.

The farm dairy, Gurler.....	1073
The care of milk on the farm, Whitney.....	1073
The score-card system of dairy inspection, Lane and Whitaker.....	1073
Dairy investigations, Hunziker.....	1074
The influence of interrupted milking on the composition of milk, Windisch.....	1074
How much protein to produce 1 kg. of milk? Von Marszalkowicz.....	1074
The variation in the composition of milk, Lauder.....	1074
The composition of asses' milk, Wagner.....	1074
The acidity of milk, Chapman.....	1074
Investigations on milk serum, Burr, Berberich, and Lauterwald.....	1074
Experiments on the germicidal action of cow's milk, Heinemann and Glenn.....	1075
The bactericidal property of milk, Evans and Cope.....	1076
Investigation of pasteurized milk, Galvagno.....	1077
On the therapeutic action of fermented milk, Herter.....	1077
The effect of hydrogen peroxid on tuberculous milk, Monvoisin.....	1077
Investigations on the influence of salt on butter, Fettick.....	1078
The influence of saltpeter on the quality of cheese, Wolff and Berberich.....	1078
Cracks in Cheddar [cheese].....	1078
Concerning pear tannin and the changes it undergoes in wine making, Kelhofer.....	1078
Mannitic fermentation in fruit and grape wines, Bierberg.....	1078
Investigations on wine making with sterilized must, Rosenstiehl.....	1078
The participation of yeasts and the variety of grapes in the formation of the bouquet of wine, Rosenstiehl.....	1078
The oil trade at Marseille.....	1079
Rock salt [in Louisiana], Harris, Maury, and Reinecke.....	1079

VETERINARY MEDICINE.

The systematic relationships of the Coccaceæ, C. E. A. and A. R. Winslow.....	1079
Practical bacteriology, blood work, and animal parasitology, Stitt.....	1079
Contribution to the study of the bacterial flora of eggs, Chrétien.....	1080
Researches on the pathogenic anaerobes, Von Hibler.....	1080
The ultraviolet viruses, M'Fadyean.....	1080
Immune sera, Bolduan.....	1080
Some examples of malignant disease in animals, Cleland.....	1080
Veterinary division, Grist.....	1081
Experiments regarding the diagnosis of anthrax, Mazzini.....	1081
Vaccination against symptomatic anthrax, Leclainche and Vallée.....	1081
The cause, prevention, and treatment of Mediterranean fever, Bassett-Smith.....	1081
Experimental study of fate of tetanus toxin in digestive canal, Vincent.....	1081
Trypanosomiasis of domestic stock in Rhodesia, Montgomery and Kinghorn.....	1081
Reports of the "sleeping sickness" expedition to the Zambesi for the years 1907-8, Kinghorn and Montgomery.....	1081
Occurrence of a large trypanosome in blood of native cattle in China, Heanley.....	1082
A peculiar form of streptotrichosis among cattle, Holmes.....	1082
Redwater in England and its carriers, Stockman.....	1082
Investigations on hog cholera and methods for its control, Uhlenhuth et al.....	1083
Suggestions for an organized plan to combat hog cholera, Melvin.....	1084
Investigations into the hematogenous nephritis of swine, Degen.....	1084
Infectious anemia of the horse, Francis and Marsteller.....	1085
Immunization against glanders, Marxer.....	1085
The mallein reaction in nonglandered horses, Südmersen.....	1085
Preventive vaccination against strangles, Baldrey.....	1085
Investigations of an outbreak of horse surra with result of treatment, Holmes.....	1085
Continuation of experiments on inoculation against piroplasmosis, Theiler.....	1086
Typhoid fever of the horse—a piroplasmosis, Pricolo.....	1086
A résumé of our knowledge of canine piroplasmosis, Peace and Gunn.....	1086
A résumé of our knowledge of canine piroplasmosis, Barry.....	1086
Acariasis as found in the transport animals employed on field service, Montgomery.....	1087
Prophylaxis of trypanosomiasis with reference to camel, Montgomery.....	1087
Concerning certain parasitic protozoa observed in Africa, Dutton et al.....	1087
Some parasites in museum of school of tropical medicine, Liverpool, Lee.....	1087
The presence of <i>Sporocheta duttoni</i> in the ova of <i>Ornithodoros moubata</i> , Carter.....	1087
On the morphology and life history of <i>Sporocheta duttoni</i> , Broad.....	1087
Contribution to the study of <i>Paracaphalus moniliformis</i> , Broden and Reelham.....	1087

## RURAL ENGINEERING.

	Page.
Irrigation in the Sacramento Valley, California, Fortier et al.....	1087
The hydrologic station of Abbeville, Houllier and Pellet.....	1088
Earth roads, Hirst.....	1088
The earth road drag, Hirst.....	1088
Stone and gravel roads, Hirst.....	1088
Culverts and bridges, Hirst.....	1088
Implements and machinery at the Smithfield Show.....	1089
Trials with seed drills and cultivators, Birk.....	1089
Water aspirators for homes, Norton.....	1089
Practical paint tests in 1907, Ladd.....	1089

## RURAL ECONOMICS.

Report of the Country Life Commission, Bailey et al.....	1089
Rural conditions in Maine, Lyons.....	1089
Farming west of the 100th meridian, Wilson.....	1090
Agriculture in the Po Valley.....	1090
Agriculture in Bavaria according to the latest statistics, Zahnbrecher.....	1090
[Land occupation, live stock, and agriculture in New Zealand], Von Dadelszen.....	1090
Crop Reporter.....	1090
Scientific investigation and its relation to practical farm work, James.....	1090
The problem of farm returns, Ostermayer.....	1090
The supply of farm labor, Holmes.....	1090
A history of the English agricultural laborer, Hasbach.....	1091
The breaking of contracts by agricultural laborers, Mendelson.....	1091
Free agricultural employment agencies in Sweden, Müller.....	1091
State assistance to agriculture in Switzerland, Von Hennet.....	1091
The encouragement of agriculture [in Switzerland].....	1091
The union of Swiss peasants.....	1091
Concerning the establishment of a central agricultural credit bank, Camanni.....	1091
Report on cooperative credit societies in the Punjab for 1908, Wilberforce.....	1091

## AGRICULTURAL EDUCATION.

The college of agriculture and the State, Bailey.....	1092
Agriculture in secondary schools, Hunt.....	1092
Rural education, True.....	1092
The education of the farmer, De Mar.....	1092
Domestic science, Penrose.....	1092
The nature-study outlook, Bailey.....	1092
Wanted: A philosophy of nature study, Robison.....	1093
The training of teachers of nature study, Shepherd et al.....	1093
Nature courses and science courses, Ganong.....	1093
Recent aspects of the nature-study movement, Davenport.....	1093
A school-room study of a robin's nest, Mann.....	1094

## MISCELLANEOUS.

Twenty-first Annual Report of Arkansas Station, 1908.....	1094
Twenty-first Annual Report of Indiana Station, 1908.....	1094
Twenty-first Annual Report of Louisiana Stations, 1908.....	1094
A visitor's guide to the station's work, Ballou.....	1094
Accessions to the Department Library, October-December, 1908.....	1094

# LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

## *Stations in the United States.*

Alabama Canebrake Station:	Page.
Bul. 26, Jan., 1909.....	1029, 1030
Arkansas Station:	
Bul. 103, 1909.....	1068
Twenty-first An. Rpt. 1908...	1094
Connecticut State Station:	
Bul. 162, Jan., 1909.....	1040
Bul. 163, Feb., 1909.....	1022
Bien. Rpt. 1907-8, pt. 10.....	1065
Bien. Rpt. 1907-8, pt. 11.....	1048
Connecticut Storrs Station:	
Bul. 54, Dec., 1908.....	1052
Bul. 55, Feb., 1909.....	1070
Florida Station:	
Bul. 96, Jan., 1909.....	1066
Bul. 97, Feb., 1909.....	1053
Bul. 98, Mar., 1909.....	1045
Georgia Station:	
Bul. 82, Oct., 1908.....	1036
Illinois Station:	
Circ. 125, Dec., 1908.....	1066
Circ. 126, Dec., 1908.....	1068
Circ. 127, Jan., 1909.....	1022
Indiana Station:	
Twenty-first An. Rpt. 1908...	1017,
	1037, 1043, 1044, 1074, 1094
Louisiana Stations:	
Geol. Survey Bul. 7, 1908....	1079
Twenty-first An. Rpt. 1908...	1094
Maine Station:	
Bul. 161, Nov., 1908.....	1054
Bul. 162, Dec., 1908.....	1049
Maryland Station:	
Bul. 131, Nov., 1908.....	1053
Massachusetts Station:	
Met. Buls. 241-242, Jan.-Feb.,	
1909.....	1012
Minnesota Station:	
Bul. 112, Dec., 1908.....	1049
Montana Station:	
Bul. 74, Dec., 1908.....	1028
New Jersey Stations:	
Bul. 219, Feb. 1, 1909.....	1037
New York State Station:	
Bul. 311, Jan., 1909.....	1043, 1044
Bul. 312, Jan., 1909.....	1052
North Dakota Station:	
Bul. 81, Sept., 1908.....	1089
Bul. 83, Nov., 1908.....	1068
Ohio Station:	
Bul. 198, Nov., 1908.....	1048
Bul. 199, Dec., 1908.....	1055
Bul. 200, Dec., 1908.....	1040
Bul. 201, Jan., 1909.....	1065
Circ. 85 1908.....	1094
Circ. 86, Dec. 7, 1908.....	1030

## *Stations in the United States—Continued.*

Ohio Station—Continued.	Page.
Circ. 87, Dec. 30, 1908.....	1036
Circ. 88, Feb. 15, 1909.....	1030
Pennsylvania Station:	
Bul. 89, Jan., 1909.....	1032
Bul. 90, Mar., 1909.....	1017
South Carolina Station:	
Bul. 141, Feb., 1909.....	1055
Tennessee Station:	
Bul. 81, Dec., 1908.....	1054
Bul. 82, Dec., 1908.....	1031
Texas Station:	
Bul. 116, Dec., 1908.....	1055
Bul. 117, Nov., 1908.....	1065
Bul. 118, Feb., 1909.....	1038
Bul. 119, Dec., 1908.....	1084
Virginia Truck Station:	
Circ. 1, Feb. 18, 1909.....	1044
Washington Station:	
Bul. 87, 1909.....	1037
Popular Bul. 12, Nov., 1908...	1073
Popular Bul. 13, Jan., 1909...	1056

## *U. S. Department of Agriculture.*

Food Insp. Decisions 104-106.....	1060
Notices of Judgment 38-49.....	1060
Bureau of Animal Industry:	
Circ. 139.....	1073
Circ. 140.....	1070
Bureau of Chemistry:	
Bul. 120 (10 cents).....	1063
Bul. 121 (10 cents).....	1060
Bureau of Entomology:	
Bul. 12, pt. 8 (tech. ser.) (10	
cents).....	1051
Bureau of Plant Industry:	
Bul. 142 (10 cents).....	1027
Bul. 143 (10 cents).....	1033
Bul. 144 (15 cents).....	1044
Circ. 24.....	1028
Doc. 392.....	1037
Bureau of Soils:	
Bul. 56 (10 cents).....	1016
Bureau of Statistics:	
Crop Reporter, vol. 11, No. 4,	
Apr., 1909.....	1090
Weather Bureau:	
Monthly Weather Review,	
vol. 36, Nos. 11-12, Nov.-	
Dec., 1908 (20 cents per	
number, \$2.50 per year)....	1012
Office of Experiment Stations:	
Bul. 207 (15 cents).....	1087
Library:	
Bul. 70 (10 cents).....	1094

NOTE.—The publications of the United States Department of Agriculture, except those of the Weather Bureau, may be purchased from the Superintendent of Documents, Washington, D. C. For the publications of the Weather Bureau requests and remittances should be directed to the Chief of the Bureau. The price of *Experiment Station Record* is \$1.50 per volume, or 15 cents per number. The prices of other technical publications are given above. The publications of the State experiment stations are distributed from the stations and not from the Department.

# EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, PH. D., *Assistant Director*.

Assistant Editor: H. L. KNIGHT.

## EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. BEAL.  
Agricultural Botany and Vegetable Pathology—W. H. EVANS, Ph. D.  
Field Crops—J. I. SCHULTE.  
Horticulture and Forestry—E. J. GLASSON.  
Foods and Human Nutrition—C. F. LANGWORTHY, Ph. D.  
Zootechny, Dairying, and Agrotechny—E. W. MORSE.  
Agricultural Chemistry—W. H. BEAL, C. F. LANGWORTHY, and E. W. MORSE.  
Economic Zoology, Entomology, and Veterinary Medicine—W. A. HOOKER.  
Rural Engineering—G. A. GRIFFIN.  
Rural Economics—J. B. MORMAN.  
Agricultural Education—D. J. CROSBY.

## CONTENTS OF VOL. XX, NO. 12.

	Page.
Editorial notes:	
Close of the twentieth volume of the <i>Record</i> .....	1101
Recent work in agricultural science.....	1102
Notes.....	1200

## SUBJECT LIST OF ABSTRACTS.

### AGRICULTURAL CHEMISTRY.

Principles and practice of agricultural analysis, Wiley.....	1102
Report of progress in agricultural chemistry in 1907, Dietrich et al.....	1102
Important articles on sugar chemistry in 1908, Von Lippman.....	1102
The solubility of lime in water, Moody and Leyson.....	1102
The decomposition of feldspar by water, Funk.....	1102
The different forms of nitrogen in proteins, Osborne et al.....	1102
Products formed by the decomposition of casein, Bissegger and Stegmann.....	1103
On the presence of isoleucin in casein, Weitzenböck.....	1103
A note on the constitution of phytin, Winterstein.....	1104
The inversion of cane sugar by invertase, H, Hudson.....	1104
Gravimetric determination of nitric acid, Hes.....	1104
Modification of the Kjeldahl method, Corradi.....	1104
The determination of potash as potassium molybdic phosphate, Schlicht.....	1104
On the quantitative determination of potash, Kühl.....	1105
Determination of insoluble phosphoric acid, Carpenter.....	1105
The determination of phosphoric acid in Thomas slag, Romanski.....	1105
Determination of caustic lime, Philsosephoff.....	1105
Report of committee on methods of analysis of water and sewage, Phelps et al.....	1105
The examination of waters in place, Klut.....	1105
Detection and determination of nitrates and nitrites in water, Tabuteau.....	1105
A new method of detecting nitrites in drinking water, Rochaix.....	1105
The estimation of urea in urine, Benedict and Gephart.....	1105
The determination of total sulphur in urine, Gill and Grindley.....	1106
Identification of horse meat by the biological method, Baer and Reuchlin.....	1106
The identification of horse meat in sausage, Behre.....	1106
The accumulation of tyrosin in preserved liver, Behre.....	1106

The determination of malic acid in food products, Cowles, jr.	110
Estimation of tartaric in presence of malic and succinic acids, Gowing-Scopes.	110
The determination of boric acid with iodine, Barthe.	110
Work of Commission for Uniform Methods of Sugar Analysis, Wiechmann.	110
History, manufacture, and analysis of maple products, Sy.	110
The lead value of maple products, Sy.	110
Estimation of benzaldehyde in almond extracts, Woodman and Lyford.	110
The determination of aldehydes in oil of lemon, Bennett.	110
The detection of caramel in vanilla extract, Woodman and Newhall.	110
A color reaction for mustard, Merl.	110
A doubtful color reaction, Merl.	110
Decree relating to methods for analysis of wines, alcohol, brandies, and liqueurs.	110
Analysis of milks, Hinard.	110
On the testing for ferments, especially in milk, Rothenfusser.	110
On milk judging, Christensen.	110
A new reaction differentiating raw from heated milk, Wilkinson and Peters.	110
The freezing point of milk as affected by the addition of water, Fischer.	110
The freezing point of milk, Atkins.	110
Contrivance for determination of fat in milk by Gottlieb-Röse method, Rieter.	110
The determination of fat in skim milk, Lezé.	110
A study of the Lezé process for the analysis of skim milk, Lezé et al.	110
Rapid method for estimation of formaldehyde in milk, Shrewsbury and Knapp.	110
Disadvantages of potassium bichromate as a preservative, Monvoisin.	110
The determination of the moisture content of butter, Bengen.	110
Studies on fatty acids in butter, Dons.	110
The Müntz-Coudon number in butters from the vicinity of Pavia, Monti.	110
Artificial means of increasing the Reichert-Meissl value of butter fat, Fincke.	110
The determination of sugar in molasses feeds by polarization, Herles.	110
Rapid determination of oil in cotton-seed products, Herty, Stem, and Orr.	110
The higher melting point constituents of Japanese fish oil, Okada.	110
Detection of savin oil, Beythien and Atenstädt.	110
Characteristics of ergot and lycopodium oils and areca-nut fat, Rathje.	110
[Miscellaneous analyses], Annett.	110
[Miscellaneous analyses], Graftiau.	110
[Miscellaneous analyses], Sedgwick.	110
[Miscellaneous analyses], McCrae.	110

## METEOROLOGY—WATER.

Introduction to weather forecasting, Van Bebbber.	1110
Constantly appearing secondary maxima and minima, Van Rijckevorsel.	1110
The isothermal layer of the atmosphere and atmospheric radiation, Gold.	1110
The isothermal layer of the atmosphere, Craig, Dines, Hughes, and Gold.	1110
Recent observations in atmospheric electricity, Dike.	1110
Origin of ozone and of variation of carbon dioxide in air, Henriët and Bouyssy.	1110
Analyses of air, Miquel.	1110
[Meteorological observations in Trinidad], Hart and Millen.	1110
The rainfall in Natal, Nevill.	1110
Contributions to hydrology, Dessoliers.	1110
Underground waters of Georgia, McCallie.	1110
Dew ponds, Hubbard.	1110
A phase of ground water problems in the West, Mendenhall.	1110
The presence of nitrites and ammonia in drinking water, Van Eyk.	1110
The removal of iron from well water, Peters.	1110
The purification of ground waters containing iron and manganese, Weston.	1110
Chemical purification of drinking water in the country, Laurent.	1110
The recent Parisian experiments on water sterilization by ozone, Daage.	1110
Sterilization of potable water by the mercury vapor lamp, Courmont and Nogier.	1110
Examination of water, Miquel.	1110

## SOILS—FERTILIZERS.

The soil, Hall.	1113
The genetic classification of soils, Tulaikov.	1113
Soil investigations, I, Björlykke.	1113
Biochemical studies in forest soils, Albert and Luther.	1113
Chemico-agricultural study of the soils of Poggiomarino, De Grazia.	1113

	Page.
Accumulation of nitrogen, carbon, and humus in a prairie soil, Alway and Vail.....	1114
Soil acidity in its relation to lack of available phosphates, Stoddart.....	1114
The problem of our unproductive lands, Cherry.....	1114
Effect of various mulching materials on the productiveness of soils, Clausen....	1115
Fixation of free nitrogen, nitrification, etc., Koch.....	1115
Assimilation of free nitrogen by <i>Azotobacter</i> and <i>Radiobacter</i> , Stoklasa et al....	1115
Nitrogen and nitragin, Ewart.....	1116
The inoculation of leguminous crops, Chittenden.....	1116
Experiments on the value of nitro-bacterine, Gimingham.....	1116
Experiments on the value of nitro-bacterine, Keeble.....	1116
Experiments on the value of nitro-bacterine, Chittenden.....	1117
Nitro-bacterine, Henslow.....	1117
Experiments with nitro-bacterine, Bottomley.....	1117
Investigations on lime nitrogen and nitrogen lime, Sabaschnikoff.....	1117
The chemical changes in lime nitrogen when used as a fertilizer, Kappen.....	1117
The decomposition of lime nitrogen, III, Löhnis and Moll.....	1117
Is dicyandiamid a poison for field crops? Loew.....	1118
An observation on calcium cyanamid, Aeby.....	1118
The assimilation of potash by plants, Krüger.....	1118
Phonolith, so-called potash silicate, as a fertilizer, Wagner.....	1118
On the fertilizing value of the phosphoric acid of vivianite, Böttcher.....	1119
The phosphorites of Gafsa, Tebessa, and Cape Leuca, Rossi.....	1119
Namban Creek phosphatic deposits, Mann et al.....	1119
Phosphatic and gypsum deposits, Despeissis.....	1119
The present status of the nitrate industry of Chile, Gerlach.....	1119
The Chilean nitrate fields.....	1119
Analyses of fertilizers, Rose.....	1119
Commercial fertilizers, Calvert.....	1120

## AGRICULTURAL BOTANY.

Linnæus's lectures on the cultivation of plants, Swederus.....	1120
The weeds and suspected poisonous plants of Queensland, Bailey.....	1120
Triple hybrids, De Vries.....	1120
The chemistry of plants, André.....	1120
The biochemistry of animals and plants, Rosenheim.....	1120
Some problems and results of a study of the mechanics of plant anatomy, Küster.....	1121
Effects of variations in the inorganic salts upon nutrition, Moore et al.....	1121
Inorganic nutrients in bean seedlings, II, Von Portheim and Samec.....	1121
The phosphorus nutrition of plants, Cavalier and Artus.....	1122
Phosphorus and the formation of amino acids by the higher plants, Scurti.....	1122
The decomposition of sugar during the processes of respiration, Jensen.....	1122
On the "strength" and development of the grain of wheat, Brenchley.....	1122
The presence of amylase in old seeds, Brocq-Rousseu and Gain.....	1123
The presence of oxydases in india rubber, Spence.....	1123
Relation of plant growth and vegetation forms to climatic conditions, Thornber.....	1123
Plant culture in diffused daylight, Bergurstein.....	1124
The influence of light on the development of fruits and seeds, Lubimenko.....	1124
The influence of radium rays on a few life processes of plants, Gager.....	1124
Electroculture, Martin.....	1124
The beginning of the development of perennial and annual plants, André.....	1125
The perennation of the clover dodder ( <i>Cuscuta epithymum</i> ), Stewart and French.....	1125
On the parasitism of <i>Siphonostegia</i> , Kusano.....	1126
Studies on <i>Æginetia indica</i> , Kusano.....	1126

## FIELD CROPS.

Report on the agricultural and botanical departments, Barbados, Morris.....	1126
Nitrogen fertilizer experiments on meadows, Bachmann.....	1127
Manurial experiments on grass land, 1908, Percival.....	1127
Rotation experiment, Greig.....	1127
The utilization of straw, Grégoire.....	1128
Southern crops, edited by Hunnicutt.....	1128
Cotton production in Egypt, Roux.....	1128
International Cotton Congress, Paris, 1908.....	1128
Variety tests by German station for potato culture, Von Eckenbrecher.....	1128

Potato variety tests conducted by F. Heine at Hadmersleben, 1908, Oetken.....	1
The beet-sugar industry, Blue.....	1
Tobacco, Smith.....	1
Notes on tobacco, Van Leenhoff.....	1
How to produce bright tobaccos, Van Leenhoff.....	1
Report on turnip experiment, 1907, Greig.....	1
On the inheritance of strength in wheat, Biffen.....	1

## HORTICULTURE.

The scientific aspects of Luther Burbank's work, Jordan and Kellogg.....	1
Vegetable growing in Cuba, Austin and Halstead.....	1
The home garden, Rexford.....	1
Report of government experimental fields in South Holland, 1908, Claassen et al.....	1
Influence of the stock on the scion, Rivière and Bailhache.....	1
New experiments in fertilizing grapes, Stoklasa.....	1
Viticulture with reference to the Rhenish Palatinate, Bassermann-Jordan.....	1
Date varieties for the Southwest, Coit.....	1
Scheme for classification of the olives grown in southern Italy, Marinucci.....	1
The coffee tree, Dieseldorff.....	1
The mangoes of Bhagalpur, Woodhouse.....	1
The book of the pansy, viola, and violet, Crane.....	1
Classified list of daffodil names, 1908.....	1
The encyclopedia of gardening, Sanders.....	1
Garden design—comparative, historical, and ethical, Mawson.....	1
The practice of garden design, Mawson.....	1

A park system for the city of Cincinnati, Kessler.....	1

## FORESTRY.

Trees, Ward.....	11
The trees of Great Britain and Ireland, Elwes and Henry.....	11
Woods and forests in Jamaica, Fawcett.....	11
Micrography of the woods of Javanese trees, Moll and Janssonius.....	11
The pines of Mexico, Shaw.....	11
Monterey pine, Albert.....	11
Canary Islands pine, Albert.....	11
Sand-binding plants, Iyer.....	11
Timber, Baterden.....	11
Planting and care of a forest of evergreens, Knechtel.....	11
A new planting method in forests, Kozesnik.....	11
Forest valuation and forest statics, Stoetzer.....	11
Is permanent forestry justified from a financial point of view? Fredenberg.....	11
Report of the Pennsylvania Department of Forestry for the year 1907.....	11
Report of the superintendent of forestry, Campbell.....	11
The Dominion forest reserves, Knechtel.....	11
Report of the Rocky Mountains Park of Canada, Douglas and Sanson.....	11
Report of the reforestation on waste lands in southern Ontario, 1908, Zavitz.....	11
Report of the superintendent of forestry, Hosmer.....	11
Report of the forest nurseryman, Haughs.....	11
Report of the director of forestry of the Philippine Islands for 1908, Ahern.....	11
Para rubber cultivation, Mathieu.....	11
Distribution of [Guayule] rubber in different parts of the shrub, Whittelsey.....	11
[Rubber tapping and mechanical tests of Surinam woods], Van Asbeck.....	11
The direct utilization of latex in the industries, Morisse.....	11

## DISEASES OF PLANTS.

A method of checking parasitic diseases in plants, Potter.....	11
Mucor cultures, Sumstine.....	11
Further studies on anthracnoses, Shear and Wood.....	11
Cultures of Uredineæ in 1908, Arthur.....	11
Notes on <i>Sclerospora graminicola</i> , Traverso.....	11
A leaf blight of beans, Ferraris.....	11
Artificial cultures of <i>Phytophthora</i> with special reference to oospores, Clinton.....	11
Studies of the potato fungus ( <i>Phytophthora infestans</i> ), Jones and Giddings.....	11
A disease of tomatoes, Vera.....	11

	Page.
Studies of two species of <i>Gloeosporium</i> , Lasnier.....	1139
Investigations on the development of <i>Gloeosporium nervisequum</i> , Guilliermond.....	1139
Experiences on the control of grape downy mildew in 1908, Chappaz.....	1139
The mildews of the grape, Evans.....	1140
Note on the European apple-tree canker fungus, Evans.....	1140
Diseases of the olive, Navarro and Noriega.....	1140
The injurious action of calcium cyanamid on olive trees, Francolini.....	1140
A bacterial disease of the peach, Rorer.....	1140
The immunity of <i>Coffea congestis</i> to <i>Hemileia vastatrix</i> , Dubard.....	1141
Witches' broom disease of cacao, Van Hall and Drost.....	1141
Root rot, Despeissis.....	1141
Relation of wound parasites to the heartwood of the affected tree, Spaulding..	1142
Rusts on the leaves of bamboos, Kusano.....	1142
A new disease of oaks, Fiori.....	1142
Oak mildew in the southwest of France, Gard.....	1142
Biology of the chrysanthemum rust, Kusano.....	1142
A bacterial gall of the daisy and its relation to other gall formations, Townsend..	1143
Leaf spot of <i>Odontoglossum</i> , Potter.....	1143
Transmissibility of the cause of olive tuberculosis to the oleander, Savastano..	1143
Report of the Phytopathological Institute of Wageningen for 1907, Ritzema Bos..	1143

## ECONOMIC ZOOLOGY—ENTOMOLOGY.

Economic zoology, Osborn.....	1144
A German-French glossary of anatomical and zoological terms, Blanchard....	1144
Type-specimens of mammals in the National Museum, Lyon, jr., and Osgood..	1144
The fauna of Mayfield's cave, Banta.....	1144
Annual report of the chief inspector of rabbits, Crawford.....	1144
Plague among the ground squirrels of California, Wherry.....	1144
Experiments on the use of <i>Bacillus pestiscaviæ</i> as a rat virus, Wherry.....	1144
Outbreak of illness caused by vermin-destroying virus, Collingridge.....	1145
The birds of Tierra del Fuego, Crawshaw.....	1145
The barred owl, red-shouldered hawk, and barn owl on Staten Island, Chapin..	1145
The food of some British birds, Newstead.....	1145
Philippine ornithological literature, I, McGregor.....	1145
Notes on a collection of birds from Siquijor, Philippine Islands, McGregor....	1145
Priority and practical entomology, Lefroy.....	1145
Insects: The rôle they play in the transmission of disease, Albert.....	1145
How best to control and eradicate insect enemies and pests, Whiteside.....	1145
New pests we should guard against, Ehrhorn.....	1145
Economic insects and plant diseases of Indiana, Douglass.....	1146
The principal insects injurious to horticulture during 1906-7, Swenk.....	1146
Scale insects injurious in Nebraska during 1906-7, Smith.....	1146
Injurious insects and other animals observed in Ireland during 1907, Carpenter..	1146
Insect investigations in Mexico, Koebele.....	1146
Report of the entomologist and vegetable pathologist, Tryon.....	1147
Annual report of the assistant entomologist, Newman.....	1147
Insects and other Arthropoda collected in the Congo Free State, Newstead et al..	1147
A guide to the study of Australian butterflies, Rainbow.....	1147
Notes on the life histories of certain wood-boring lepidoptera, Williams.....	1147
Notes on the study of some Iowa Coleoptera, Rowley.....	1147
The fauna of British India, including Ceylon and Burma, Coleoptera.....	1147
The distribution of the North American species of <i>Phytonomus</i> , Webster.....	1147
Notes on Tenthredinoidea, with descriptions of new species, II-V, Rohwer....	1147
A note on the habits of Aphilanthops, Ainslie.....	1147
Notes on some Chalcidoidea, Crawford.....	1147
Two new seed-infesting chalcid flies, Crosby.....	1148
A key to the species of <i>Prospaltella</i> , with hosts and new species, Howard.....	1148
Comparative ethology of the European and North American ants, Wheeler.....	1148
Honey ants, with a revision of the American <i>Myrmecocysti</i> , Wheeler.....	1148
The ants of Casco Bay, Maine, Wheeler.....	1148
The ants of Texas, New Mexico, and Arizona, I, Wheeler.....	1148
The ants of Porto Rico and the Virgin Islands, Wheeler.....	1148
The ants of Jamaica, Wheeler.....	1148
The fauna of British India, including Ceylon and Burma. Ryhnechota. Distant..	1148
A catalogue of the hemiptera of Fiji, Kirkaldy.....	1148
Life histories of some Philippine Cassididæ, Schultze.....	1148

Studies on Aphididæ, I, Davis.....	111
<i>Phyllaphis coweni</i> , Gillette.....	111
The Lecanium of Robinia, Marchal.....	111
On Thysanoptera, Franklin.....	111
A report on the species of Siphonaptera found in San Francisco, Fox.....	111
Revision of the noncombed eyed Siphonaptera, Jordan and Rothschild.....	111
Two little-known aphids on <i>Carex</i> sp., Gillette.....	111
The preparatory stages of <i>Euchloe sara</i> , Coolidge and Newcomer.....	111
Weevils and other insects affecting grains and cereal products, Ramírez.....	111
Notes on <i>Contarinia sorghicola</i> , Herrick.....	111
Poisoned bait remedy [for cutworms], Mally.....	111
Powdered arsenate of lead as a boll weevil poison, Newell and Barber.....	111
Destroying the boll weevils before they enter hibernation, Newell.....	111
What constitutes a perfect stand of cotton when fighting the boll weevil? Newell.....	111
Maize stalk borer ( <i>Sesamia fusca</i> ), Mally.....	111
Insect enemies of cotton, Sherman, jr.....	111
<i>Notophallus hæmatopus</i> attacking peas in France, Marchal.....	111
Further biological notes on the Colorado potato beetle, Girault.....	111
Contribution to the study of the sugar-cane borers, Lévy.....	111
Paper on the frog hopper, McLeod.....	111
Insects injurious to tobacco, Anastasia.....	111
A new vegetable pest—the tomato weevil, French, jr.....	111
The Japanese Coccidæ, Cockerell.....	111
The San José scale ( <i>Aspidiotus perniciosus</i> ) and methods of treatment, Stene.....	111
The fruit-infesting forms of <i>Rhagoletis</i> , with one new species, Aldrich.....	111
Annual report of the chief orchard inspector, Hooper.....	111
Observations on the oviposition of <i>Cecanthus quadripunctatis</i> , Jensen.....	111
The woolly aphis of the apple tree, Inda.....	111
The apple blossom weevil, Collinge.....	111
[The olive fly and methods of control].....	111
Some new and undescribed insect pests affecting cocoa in West Africa, Graham.....	111
On a new species of Kermes destructive to oak trees in North India, Green.....	111
The large larch sawfly, Hewitt.....	111
The Monterey pine resin midge ( <i>Cecidomyia resinicoloides</i> n. sp.), Williams.....	111
Biological studies on bark beetles, Hennings.....	111
The fumigation of nursery stock, Douglass.....	111
Some new species and a new genus of American mosquitoes, Dyar and Knab.....	111
Mosquito comment, Dyar and Knab.....	111
On the larval and pupal stages of <i>Anopheles maculipennis</i> , Imms.....	111
Biology of Philippine Culicidæ, Banks.....	111
New Philippine mosquitoes, Ludlow.....	111
Millions and mosquitoes, Ballou.....	111
Possibility of the mosquito acting in the transmission of leprosy, Brinckerhoff.....	111
Bibliography on flies and mosquitoes as carriers of disease, Gerhard.....	111
A preliminary account of the biting flies of India, Lefroy.....	111
A new species of <i>Ceratophyllus</i> , Fox.....	111
The tumbu-fly ( <i>Cordylobia anthropophaga</i> ), Austen.....	111
Description of two new species of African ticks, Neumann.....	111
The structure and biology of <i>Hamaphysalis punctata</i> , I, Nuttall et al.....	111
Experimental studies on the transmission of recurrent fever by ticks, Möllers.....	111
Spirochetosis transmitted in Tunis by <i>Argas persicus</i> , Galli-Valerio.....	111
Mycetozoan endoparasites of insects. I, <i>Sporomyxa scauri</i> , Léger.....	111
The house cockroach, Inda.....	111
Descriptions and records of bees, Cockerell.....	111
Report of State inspector of apiaries, Darby.....	111
The hive and honey bee, Langstroth, rev. by Dadant.....	111
A guide to the culture of mulberry trees and silkworms, Bolle.....	111
Inheritance in silkworms, I, Kellogg.....	111

## FOODS—HUMAN NUTRITION.

On the presence of tin in certain canned foods.....	115
The deterioration of frozen beef, Richardson and Scherubel.....	115
Refrigeration and the preservation of meat, Ferretti.....	115
Food products at the First International Cold Storage Congress, Bouvier.....	115
The preserving of fruits, vegetables, and meat, Albert.....	115
Temperature in sterilizing vegetables and fruits, Kochs and Weinhausen.....	115

	Page.
The manufacture of preserved vegetables, Ott.....	1157
Preserved fruits in Europe, Washington and Skinner.....	1157
Canning and preserving, Ellsworth.....	1157
Slaughtering and meat packing.....	1157
The examination of sausage, Roth.....	1157
Spectroscopic properties of yolk of egg, Lewin, Miethé, and Stenger.....	1158
The nutritive value and digestibility of eggs, Aufrecht and Simon.....	1158
Desiccated milk, Booth.....	1158
Notes on investigations on the nutritive value of plant amids, Schulze.....	1158
Starch, Merriam.....	1158
On some vegetable fats native to Sarawak, Hewitt.....	1158
Befri seed, Michael.....	1158
Sensitiveness to light of white animals fed buckwheat, Ohmke.....	1158
Pellagra, a précis, Lavinder.....	1158
Corn oil in the treatment of pulmonary tuberculosis, Ritter.....	1159
Methods of preparing corn by Indians of Arizona and New Mexico, Krulish.....	1159
Some useful maize dishes.....	1159
Rice, cleaning and polishing, Fulgham.....	1159
Flour and grist mill products, Ellsworth.....	1159
Milling of wheats, Brunnich.....	1159
Hungarian wheat and Hungarian flour, Kosutány.....	1159
The theory and practice of testing flour, Kennedy.....	1159
Defense of the bleaching of flour, Elliott.....	1160
Air bleaching of flour in the doughing state, Cristadora.....	1160
Fungus and bacterial growth on stored flour, Bell.....	1160
The water content of bread, Mezger.....	1160
Concerning the potato content of bread, Tóth.....	1160
Sophisticated zwieback, Glaser.....	1160
The iron and phosphorus content of vegetables, Haensel.....	1161
Beans containing hydrocyanic acid, Guignard.....	1161
Canned vegetables containing copper, Graff.....	1161
Change in composition of tropical fruits during ripening, Prinsen Geerligs.....	1161
A sweetmeat from bananas, Totten.....	1161
Sulphured fruit, Lührig.....	1162
[Wholesomeness of sulphured fruits], Atkins.....	1162
Vegetables and fruit as articles of diet and remedial agents, Brass.....	1162
Viscosity of cane-sugar molasses, Prinsen Geerligs.....	1162
Maple sirup, Thurston.....	1162
The honey produced by sugar-fed bees, Neubauer.....	1162
Concerning rose apple jam, Mezger and Fuchs.....	1162
Ice cream, McGill.....	1162
Composition of oriental foodstuffs: Bosa, halva, and locoum, Petkoff.....	1162
Cider, McGill.....	1163
Native wines, McGill.....	1163
Swiss wine statistics.....	1163
A study of certain genuine wines from Florence, Salvadori and Mazzaron.....	1163
Composition of Mâconnais-Beaùjolais wine, Paturel.....	1163
Analyses of musts and wines from vines sprayed with arsenic, Szameitat.....	1163
The occurrence of arsenic in German wines, Szameitat.....	1163
Investigation of musts and wines from vines infested with Peronospora.....	1163
Olive oil for protecting wine, Rossi-Ferri.....	1163
Effects of coffee and objections to the use of chicory, Grimshaw.....	1163
Concerning the quality of tea, Hartwich and Du Pasquier.....	1163
Concerning coco, Farnsteiner.....	1163
The microscopical examination of chocolate and powdered coco, Collin.....	1163
Pepper adulterated with vetch seeds, Fleury.....	1164
Ground pepper, McGill.....	1164
Oil of lemon, McGill.....	1164
Concerning canarium oil, Wedemeyer.....	1164
Concerning Liebig's meat extract, Engeland.....	1164
Are yeast extracts justifiable as substitutes for extract of meat? Gamgee.....	1164
Purin metabolism and yeast extracts.....	1164
Food extracts made from yeast, Chapman.....	1164
Diastase ferments, Puckner.....	1164
The factors and cost of board on Minnesota farms, Cooper.....	1164
[Standards of living of Mexican labor in the United States], Clark.....	1164
French school cantines, Goldschmidt.....	1164

The diet of the Chinese, Matignon.....	
Prices and wages in India.....	
Manual for the subsistence department United States Army.....	
United States Navy cookbook.....	
The baking trade, Wolf.....	
Plain cookery, Mulligan.....	
Large meals for little money, Johnson.....	
Treatise on food and nutrition under normal and pathological conditions, Mau.....	
A system of diet and dietetics, Sutherland.....	
Criteria and standards in infant feeding, Allen.....	
Chemistry in its relation to food, Snell.....	
Influence of feeding on chemical composition of the animal body, Mendel.....	
The resorption of protein, Von Körösy.....	
The utilization of protein cleavage products, Abderhalden and Olinger.....	
The behavior of carnitin in animal metabolism, Engeland.....	
The digestibility of fat in the animal body, III, Levites.....	
The functions of the liver in relation to the metabolism of fats, Leathes.....	
Examination of fat in liver in health and disease, Kennaway and Leathes.....	
Animal fat and the petroleum ether extract of the liver, Nukada.....	
Behavior of certain indigestible carbohydrates in the digestive tract, Mendel.....	
An improved apparatus of Regnault and Reiset type, Zuntz and Oppenheimer.....	
Adjusting the modified respiration apparatus, Schlossmann and Murschhauser.....	
Respiratory exchange of an infant, Schlossmann et al.....	
The transformation of energy in the muscles when work is performed, Maignon.....	
Effects of muscular work on the excretion of endogenous purins, Kennaway.....	
Principles of general metabolism of matter and energy, II, Krummacher.....	
International catalogue of scientific literature. Q—Physiology.....	

## ANIMAL PRODUCTION.

Reports to the evolution committee, Bateson et al.....	
The heredity of sex, Punnett and Bateson.....	
Secondary sexual characters, Müller.....	
Recessive characters, Davenport.....	
Degeneration, albinism, and inbreeding, Davenport.....	
Breeding experiments with rats, Morgan.....	
The chondriosomes as bearers of the hereditary qualities, Meves.....	
The inheritance of hyperdactylism in poultry, Barfurth.....	
Spurious allelomorphism [in poultry], Spillman.....	
Yearbook of scientific and practical animal breeding, Müller.....	
The principles of animal nutrition, Armsby.....	
The rate of growth of the egg yolk in the chick, Riddle.....	
Sudan III on the egg transmitted to the chick, S. H. and Susanna P. Gage.....	
Effect of proteid and nonproteid nitrogen on gain in weight of ruminants, Just.....	
On the influence of food fat on the body fat of swine, König and Schluckebier.....	
Daily rations approximately balanced for different animals, Dalrymple.....	
Commercial feeding stuffs of Pennsylvania in 1907, Fuller.....	
The drying of moist feeding stuffs and their agricultural significance, Meyer.....	
Corn grits and corn meal as brewing adjuncts, Wills.....	
The composition of brewers' and distillers' grains, Fagan and Allan.....	
The nutritive value of grape marc, Fabre.....	
The occurrence of cyanogenetic glucosids in feeding stuffs, Henry and Auld.....	
Farm stock, Burkett.....	
The meat industry in Hungary, Douglas.....	
Cattle raising, Dettweiler.....	
The history of cattle breeding at Einsiedeln, Ringholz.....	
The spotted cattle of southern Moravia, Nitsche.....	
Aberdeen-Angus cattle, Pulling.....	
On the protein minimum for growing wethers, Katayama.....	
Fertility in Scottish sheep, Marshall.....	
Unique experiment in sheep breeding, Spencer.....	
Caracul sheep, Pirocchi.....	
Origin of the Australian Merino.....	
Australian sheep, Bray.....	
Steamed v. dried potatoes as a feed for swine, Schmoeger.....	
The horse in history, Tozer.....	
Army remounts, O'Callaghan.....	

	Page.
Age of trotting horse sires, Marshall.....	1174
Southern poultry guide, or forty years with poultry, Husselman.....	1174
Poultry and eggs for market and export, Hyde.....	1174
Poultry and eggs, Mowrer and Skinner.....	1174
The Buff Orpington duck, Goodacre.....	1174
The care and breeding of rabbits, Mahlich.....	1174

## DAIRY FARMING—DAIRYING—AGROTECHNY.

Investigations on influence of feed on milk secretion of cows, Buschmann....	1175
The protein requirement for milch cows, Derwa.....	1175
A local cow census.....	1175
The cost of transporting a quart of milk], Graustein.....	1175
The business of dairying, Lane.....	1175
Works on the science and practice of dairying during 1908, Raudnitz.....	1176
Report of the dairy and cold storage commissioner, Ruddick.....	1176
Dairy production, 1907, Blue.....	1176
The past, the present, and the future of the dairy industry in Quebec, Chapais..	1176
Dairying in Denmark, 1907, Böggild.....	1176
Dairying in Norway prior to 1905, Benterud, Grude, and Wold.....	1176
Swedish dairying, Oestergren.....	1176
New Zealand dairy produce on the British market, Cuddie.....	1176
Biological and biochemical studies of milk, Koning.....	1176
Essentials of milk hygiene, Jensen, trans. and amplified by Pearson.....	1176
Milk as affected by stable practices and subsequent handling, Reynolds.....	1177
The influence of the sugars on the secretion of milk, Piantoni.....	1177
On the variability of milk, Von Wendt.....	1177
The effect of rutting on the composition of cow's milk, Mezger.....	1177
The composition of cow's milk of different breeds, Katayama.....	1177
On the variations of the globules of milk, Alessi and Carapelle.....	1177
Investigations on the viscosity and surface tension of milk, Kobler.....	1177
Application of new physico-chemical methods of milk investigation, Zanger..	1178
Investigations on the rennet coagulation of milk, Van Dam.....	1178
Effect of some normal elements of milk on its coagulation with rennet, Gerber..	1178
Further contributions to theory of coagulation of milk by rennet, Werncken..	1178
Microscopical studies of the colostrum of cow's milk, Schulz.....	1178
Analyses of colostrum, Siegfeld.....	1178
The proteolytic enzym of human milk, Austin.....	1179
On the nucleon content of human milk, Valenti.....	1179
On milk secretion and the microscopical testing of milk, Winkler.....	1179
Slimy milk, Eberlein.....	1179
Fermentations of milk and cheese, Koch.....	1179
On lactic-acid fermentation in milk, Beijerinck.....	1179
Lactic acid as an agent to reduce intestinal putrefaction, Heinemann.....	1179
Colloidal cream and process of making the same, Rousseau.....	1180
The preservative action of boric acid in butter, O'Callaghan.....	1180
[The effect of cold storage on the changes in butter], Rogers.....	1180
Butter, McGill.....	1180
A study of Argentine butters, Lavenir.....	1180
Danish butter exports, 1907-8, Böggild.....	1181
Denmark's butter exports during the last 25 years, Böggild.....	1181
Refrigeration and Siberian butter.....	1181
The science and practice of cheese making, Van Slyke and Publow.....	1181
Cheese making, Decker, edited by Woll.....	1181
Cheese, McGill.....	1181
Some analyses of cream cheese, Cribb.....	1181
The fat in cheese, Cornalba.....	1181
The fat content of Edam cheese, Müller.....	1181
The cheese industry of Normandy, Beau.....	1181
The cheese industry in the Rhine Province.....	1181
Casein and its applications, Richardson.....	1182
The characteristics of red currant seed oil, Krzizan.....	1182
Oil from " <i>Carapa guyanensis</i> " ( <i>Carapa procera</i> , DC.), Lewkowitsch.....	1182
The rate of fermentation of ciders and berries, Barker.....	1182
Acetic aldehyde in wine, its origin, and its significance, Trillat.....	1182
Malic acid in wine making. Malo-lactic fermentations, Mestrezat.....	1182
Report of Swiss experiment station for wine making, 1905-6, Müller-Thurgau..	1182
Agricultural and industrial distillation, Boullanger.....	1182

## VETERINARY MEDICINE.

	Page
Veterinary materia medica and therapeutics, Winslow.....	173
Further studies upon anaphylaxis, Rosenau and Anderson.....	173
Investigations of the leucocytes and lymphoid tissue of invertebrates, Kollmann.....	11
Further notes on rat leprosy and the fate of lepra bacilli in flies, Wherry.....	11
The etiology and diagnosis of hydrophobia, Williams and Lowden.....	11
The prevalence of hydrophobia in the Philippine Islands, Dudley.....	118
Transmission of rabies to mice by ingestion, Remlinger.....	118
Experiments on the production of antirabic serum, Poor and Friedman.....	118
Note on the investigation of cattle disease in Sierra Leone, Harvey.....	118
Notes on the duration and course of camel surra, Pease and Gaiger.....	118
Natural canine surra, Gaiger.....	118
Treatment of surra by atoxyl and orpiment, Holmes.....	118
The relation of human and bovine tuberculosis, Koch.....	118
Infection of dogs with the tubercle bacillus, Titze and Weidanz.....	118
Tuberculosis of parrots and canaries, Weber, Titze, and Weidanz.....	118
The ophthalmic reaction to tuberculin, Bailliart.....	118
Five years' experience of inoculation by von Behring's method, Strelinger.....	118
The vaccination of cattle against tuberculosis, Smith.....	118
The vaccination of cattle against tuberculosis, Heymans.....	118
Phagocytic immunity, Meakins.....	118
Further filtration experiments with virus of cattle plague, Ruediger.....	118
Tick fever, or redwater, Dodd.....	118
Methods adopted for the eradication of cattle ticks in the United States, Dodd.....	118
Biological study of <i>Bacillus vitulisepticus</i> and immunization of calves, Schirop.....	118
The etiology of white scour in calves, Titze and Weichel.....	118
Diarrhea in calves, Vallejo.....	118
A new Indian tick, <i>Ornithodoros lahoriensis</i> , Neumann.....	118
Infectious mastitis of the goat, Best.....	118
Swine plague, Jowett.....	118
Cure of a stallion suffering from dourine by means of atoxyl, Monod.....	118
The agglutination test as applied to the diagnosis of glanders, Collins.....	118
What should each dog owner know? Ritt.....	119
A contribution to the study of follicular mange in the dog, Almond.....	119
The morphology and life history of <i>Piroplasma canis</i> , Breinl and Hindle.....	119
The development of <i>Piroplasma canis</i> in culture, Nuttall and Graham-Smith.....	119
Mode of multiplication of <i>Piroplasma bovis</i> , <i>P. pitheci</i> in the circulating blood, compared with <i>P. canis</i> , Nuttall and Graham-Smith.....	119
Observations on piroplasmiasis of cattle and among buffaloes, Schein.....	119
A new microbe pathogenic in cats, Skrzynski.....	119
Investigations of epithelioma contagiosum of fowls, Lipschütz.....	119
Culture in vitro of the fowl plague virus, Marchoux.....	119
Spirochetosis of fowls. Transmission by <i>Argas persicus</i> , Brumpt and Foley.....	119
The air-sac mite, Nathan.....	119
Epizootic pneumo-pericarditis in the turkey, Jowett.....	119
Notes on ostrich parasites, Robertson.....	119
The cestodes of birds, Fuhrmann.....	119
Note on the behavior of Spirochaetæ in <i>Acanthia lectularia</i> , Nuttall.....	119
<i>Leucocytozoon musculi</i> , a parasitic protozoon from the blood of mice, Porter.....	119
A monozoic cestode-like parasite ( <i>Sanguinicola armata</i> and <i>inermis</i> ), Plehn.....	119
Helminthological technique, Langeron.....	119

## RURAL ENGINEERING.

Irrigated lands of United States, Canada, and Mexico, Price.....	1192
[Irrigation investigations in California], Roeding.....	1193
[Irrigation in Madras Presidency], Martin.....	1193
Mechanical irrigation stations on the Nile, Van Brussel.....	1193
Tidal power, Hornsnaill.....	1193
Third Biennial Report State Engineer, North Dakota.....	1193
Peat levees, Ellery.....	1193
The automatic water finder.....	1193
Road improvement in the United States.....	1193
Superheated-steam plowing machine.....	1194
New milking machine systems, Georgs.....	1194
Machine milking and its practical application, Ellbrecht.....	1194
Milking machines.....	1194
Ventilation of poultry houses, Mackenzie and Russell.....	1194
